MAXPROLOGIC FPGA DEVELOPMENT SYSTEM Data Sheet

The MaxProLogic is an FPGA development board that is designed to be user friendly and a great introduction into digital design for anyone. The core of the MaxProLogic is the Altera MAX10 FPGA. This powerful chip has 4,000 Logic Elements and 200Kbits of Memory. The MAX10 is easily scalable from the entry level college student to the most advanced projects like an audio sound meter with FFT. Upon the many great features of the MaxProLogic is the MAX10 chip

TERRANOLOGIC

Data Sheet TRC FPGA Development System

has a built in Flash for configuration and incorporates 8 channels of Analog to Digital Conversion. These two features alone create a far superior FPGA chip than any competitor on the market. It allows the user to create more diverse projects.

- MAX10 10M04SA FPGA From Altera
- 4,000 Logic Elements; 2.2 Mbit On chip Flash; 189 Kbit On Chip SRAM
- 8 Analog Input Channels; 12 bit; 1MSamples/Second
- 65 Available I/O's at connectors
- 8 Green User configurable LEDs
- 1 Power Pushbutton Switch; 1 User Configurable Pushbutton Switch
- On Board SD Card Slot
- Two Power options: Standard USB (+5V @ 2Amp) Using USB-C connector;
- 5mm Barrel Connector Accepts +5.5V @ 3Amp
- Switching Power Supply, Provides stable output under high load stress
- Oscillator: 50MHz
- On board interface to Standard USB to Serial Adapters

4 Pushbutton switches

There are two pushbutton switches on the MaxProLogic. Both are momentary contact switches. They include a 0.1uF cap to ground to debounce both switches. The User Push Button Switch is configurable as input only to the MAX10. The user code can read the state of the switch or use it as an event to trigger some action in the code.

Component	Net Name	Pin Number on MAX10	Signal in TRC Project Pinout
SW1	ON_OFF_CONTROL	NA	NA
SW2	PB_SWITCH_1	27	PB_SWITCH_1

SW2 is the User Configurable switch. It is assert low with a constant pullup to +3.3V. So, the switch will read high until the button is pressed in which it will read low.

TERRANOLOGIC

Data Sheet TRC FPGA Development System

TERRANOLOGIC

Data Sheet TRC FPGA Development System

SW1 is configured as the Power Switch for the MaxProLogic. JMP2 selects whether the On/Off Controller U1 is connected to the power system of the board. If the On/Off Controller (MAX16054) is not connected to the circuit, the MaxProLogic will power on when power is applied at the USB-C connector or barrel connector. If the On/Off Controller (MAX16054) is connected to the power circuit, the power button

TERRANOLOGIC

5 LEDs

There are 8 total LEDs on the MaxProLogic. All eight are green LEDs, Part Number: APT1608CGCK from King Bright. Each LED has its own current limiting resistor. The resistor is a 220 Ohm series resistor which sets the current for each LED at:

$$I_{LED} = \frac{V_O - V_F}{R}$$

$$I_{LED} = \frac{3.3V - 2.0V}{220}$$

$$I_{LED} = 5.9mA$$

TERRANOLOGIC

Data Sheet TRC FPGA Development System

Component	Net Name	Pin on FPGA	Signal in TRC Project Pinout
LED1	LED1	21	LED[0]
LED2	LED2	22	LED[1]

LED7	LED7	38	LED[6]
LED8	LED8	39	LED[7]

6 Sensor Connector

The sensor is accessed through an I2C bus. This bus is connected to the FPGA through the following pins:

Connector RefDes-Pin Number	MaxProLogic Schematic Signal	FPGA Signal Name	MAX 10 Pin Number
J14-1	+3.3V		NC
J14-2	GND		NC
J14-3	I2C_0_SDA	I2C_SDA	111
J14-4	I2C_0_SCL	I2C_SCL	110
J14-5	NC		NC
J14-6	ND		NC

The bus uses 2.7K pullups on both the SDA and SCK signals.

TERRANOLOGIC

Data Sheet TRC FPGA Development System

7 Input Power

The MaxProLogic board has three input power options:

- USB-C connector (+5V up to 2A)
- 5MM Barrel connector (+4.5V to +5.5V up to 3A)

TERRANOLOGIC

Data Sheet TRC FPGA Development System

Each of these options supplies +5VDC to the switching power supply. This power supply is a DC-DC supply that regulates efficiently and expeditiously the +3.3VDC output. All three input power options are limited to +5V input.

8 Inputs/Outputs

The MaxProLogic has eight 10 pin headers that provide 64 digital Inputs and Outputs. All of the I/O's are +3.3 VDC only. All I/O's connect directly from the FPGA to one of the ten pin headers.

TERRANOLOGIC

Data Sheet TRC FPGA Development System

All I/O's are organized into separate banks of the FPGA. There are eight banks. These different banks provide different output speed technologies. Programmable Open Drain The optional open-drain output for each I/O pin is equivalent to an open collector output. If it is configured as an open drain, the logic value of the output is either high-Z or logic low. Use an external resistor to pull the signal to a logic high. Programmable Bus Hold Each I/O pin provides an optional bus-hold feature that is active only after configuration. When the device enters user mode, the bus-hold circuit captures the value that is present on the pin by the end of the configuration. The bus-hold circuitry holds this pin state until the next input signal is present. Because of this, you do not require an external pull-up or pull-down resistor to hold a signal level when the bus is tri-stated. For each I/O pin, you can individually specify that the bus-hold circuitry pulls non-driven pins away from the input threshold voltage—where noise can cause unintended high-frequency switching. To prevent over-driving signals, the bus-hold circuitry drives the voltage level of the I/O pin lower than the VCCIO level. If you enable the bus-hold feature, you cannot use the programmable pull-up option. To configure the I/O pin for differential signals, disable the bus-hold feature. Programmable Pull-Up Resistor Each I/O pin provides an optional programmable pull-up resistor during user mode. The pull-up resistor weakly holds the I/O to the VCCIO level. If you enable the weak pull-up resistor, you cannot use the bus-hold feature. Programmable Current Strength You can use the programmable current strength to mitigate the effects of high signal attenuation that is caused by a long transmission line or a legacy backplane.

TERRANOLOGIC

Data Sheet TRC FPGA Development System

9 FPGA Configuration

The MaxProLogic has an internal Flash. This flash is used to configure the FPGA. The has a 5x2 header for use in programming the MAX10 FPGA via JTAG. The connector is located in the bottom right corner of the MaxProLogic. It is shrouded and keyed to allow easier insertion.

TERRANOLOGIC

Data Sheet TRC FPGA Development System

This connector uses the standard Altera Blaster connector pinout.

TCK	1	2	GND
TDO	3	4	VCC(TRGT)
TMS	5	6	NC
NC	7	8	NC
TDI	9	10	GND

10 Communications Interface

The MaxProLogic is equipped with a communications port that is compatible with FTDI Breakout Boards. It is a 6 pin female header that connects directly with most Breakout boards. The pinout:

TERRANOLOGIC

Data Sheet TRC FPGA Development System

Communications Connector -Pin #	Signal
J9-1	NC
J9-2	RX
J9-3	TX
J9-4	VCC
J9-5	NX
J9-6	GND

The Communications Connector provides a path between the FTDI Breakout Board and the MAX10 FPGA. It brings both the RX and TX signals into the FPGA at the following pins.

TERRANOLOGIC

Data Sheet TRC FPGA Development System

FPGA Pin #	Signal
92	RX
93	TX
