UNOPROLOGIC USB CPLD DEVELOPMENT SYSTEM

Data Sheet

The UnoProLogic is a part of the EPT USB/PLD development system. It provides an innovative method of developing and debugging the users microcontroller code. It can also provide a high speed data transfer mechanism between microcontroller and Host PC.

The UnoProLogic board is equipped with an Altera 5M570 PLD; which is programmed using the Intel Quartus Prime software. The CPLD has 570 Logic Elements which is equivalent to 440 Macrocells. An on board 66 MHz oscillator is used by the EPT-Active-Transfer-Library to

TERRANOLOGIC

User Manual EPT USB PLD Dev System

provide data transfer rates of 0.1 Mega Bytes per second. The EPT-Active-Transfer-Library provides control communication between the objective device and the CPLD. Data transfer during the objective device checkout between the PC and the CPLD program is available via the Hyper Serial Port. The board also includes the following parts.

- Intel 5M570 CPLD with 440 Macrocells
- FT2232H USB to Serial Interface chip
- 4 Channel ADC 300KSamples/Second
- 66 MHz oscillator for driving USB data transfers and users code
- Three bidirectional voltage translator/bus transceivers
- 24 user Input/Outputs available as three 8 bit ports
- Ports have jumper selectable 3.3V/5 Volt Input/Output
- Four RGB LED's accessible by the user
- Two PCB switches accessible by the user
- Two Slide Switches
- Two PMOD Connectors
- All I/O connectors stack into the Arduino Uno

7 LEDs

The User LEDs are four RGB LEDs. These LEDs are SML-LX0404 chips and are for use only with +3.3V.

TERRANOLOGIC

User Manual EPT USB PLD Dev System

The SML-LX0404 chip is a current sink and are connected to pins on the MAX V CPLD. The anode is connected to +3.3V. The series resistors are calculated for current limiting based on +3.3V.

Each series resistor uses a 220 Ohm in a resistor array. In order to light up the each LED, the user code must assert a zero on the associated signal for the LED. To turn off the LED, assert High Z on the signal.

The LED RGB signals are organized on the following pins from the MAX V chip:

LED Number	Signal Name	MAX V Pin Number
D1	LED_GREEN_1_N	57
D1	LED_BLUE_1_N	56
D1	LED_RED_1_N	55
D2	LED_GREEN_2_N	54

D4	LED_BLUE_4_N	47
D4	LED_RED_4_N	43

8 Host PC Connection

The UnoProLogic includes an LED that signifies the connection of the board with the Host PC. The connect LED has the word “CONNECT” in silkscreen next to the LED. This LED will only light up once the Host PC has correctly enumerated the USB device (FT2232HQ chip). When this LED is lit up it can tell the user three things:

- Power has been applied to the UnoProLogic via USB
- The FT2232HQ chip is working properly
- The Host PC has found the appropriate driver and will communicate with the UnoProLogic

CONNECT LED

TERRANOLOGIC

User Manual EPT USB PLD Dev System

9 Inputs/Outputs

The UnoMax is designed from the ground up as a development board for beginners. All of the Inputs/Outputs are protected by the 74LVC8245 transceiver chips. These transceivers provide both voltage level translations and protection from over current and over voltage. The transceivers can sink up to 50mA per pin.

There are 24 Inputs/Outputs which are selectable between +3.3V and +5 Volt. JMP1 is used to select which voltage the 24 Inputs/Outputs are set to.

TERRANOLOGIC

User Manual EPT USB PLD Dev System

The I/O's are organized as three 8 bit directional ports. Each port must be defined as input or output. This means that all 8 bits of a port will point in the same direction, depending on the direction bit of the transceiver. The direction bit can be changed at any time, so that a port can change from input to output in minimum setup time of 6 nanoseconds. Each port also has an enable pin. This enable pin will enable or disable the bits of the port. If the port is disabled, the bits will “float”.

TERRANOLOGIC

User Manual EPT USB PLD Dev System

This 8-bit (octal) noninverting bus transceiver contains two separate supply rails; B port has VCCB, which is set at 3.3 V, and A port has VCCA, which is set at 5 V. This allows for translation from a 3.3-V to a 5-V environment, and vice versa.

The SN74LVC4245A device is designed for asynchronous communication between data buses. The device transmits data from the A bus to the B bus or from the B bus to the A bus, depending on the logic level at the direction-control (DIR) input. The output-enable (OE) input can be used to disable the device so the buses are effectively isolated. The control circuitry (DIR, OE) is powered by VCCA.

11.2 3-Wire Serial Interface

The MAX11618–MAX11621/MAX11624/MAX11625 feature a serial interface compatible with

TERRANOLOGIC

User Manual EPT USB PLD Dev System

SPI/QSPI and MICROWIRE devices. For SPI/QSPI, ensure the CPU serial interface runs in master mode so it generates the serial clock signal. Select the SCLK frequency of 10MHz or less, and set clock polarity (CPOL) and phase

(CPHA) in the μ P control registers to the same value. The MAX11618 operate with SCLK idling high or low, and thus operate with CPOL = CPHA = 0 or CPOL = CPHA = 1. Set CS low to latch input data at DIN on the rising edge of SCLK. Output data at DOUT is updated on the falling edge of SCLK. Results are output in binary format.

Serial communication always begins with an 8-bit input data byte (MSB first) loaded from DIN. A high-to-low transition on CS initiates the data input operation. The input data byte and the subsequent data bytes are clocked from DIN into the serial interface on the rising edge of SCLK. Tables 1–5 detail the register descriptions.

Bits 5 and 4, CKSEL1 and CKSEL0, respectively, control the clock modes in the setup register. Choose between four different clock modes for various ways to start a conversion and determine whether the acquisitions are internally or externally timed. Select clock mode 00 to configure CNVST/AIN_ to act as a conversion start and use it to request the programmed, internally timed conversions without tying up the serial bus. In clock mode 01, use CNVST to request conversions one channel at a time, controlling the sampling speed without tying up the serial bus. Request and start internally timed conversions through the serial interface by writing to the conversion register in the default clock mode 10. Use clock mode 11 with SCLK up to 4.8MHz for externally timed acquisitions to achieve sampling rates up to 300ksps. Clock mode 11 disables scanning and averaging.

The device feature an active-low, end-of-conversion output. EOC goes low when the ADC completes the last requested operation and is waiting for the next input data byte (for clock modes 00 and 10). In clock mode 01, EOC goes low after the ADC completes each requested operation. EOC goes high when CS or CNVST goes low. EOC is always high in clock mode 11.

TERRANOLOGIC

User Manual EPT USB PLD Dev System

11.3 Output Data Format

Figures 4–7 illustrate the conversion timing for the MAX11618–MAX11621/MAX11624/MAX11625. The 10-bit conversion result is output in MSB-first format with four leading zeros followed by 10-bit data and two trailing zeros. DIN data is latched into the serial interface on the rising edge of SCLK. Data on DOUT transitions on the falling edge of SCLK. Conversions in clock modes 00 and 01 are initiated by CNVST. Conversions in clock modes 10 and 11 are initiated by writing an input data byte to the conversion register. Data output is binary.

11.4 Register Descriptions

The MAX11618 communicate between the internal registers and the external circuitry through the SPI-/QSPI-compatible serial interface. Table 1 details the registers and the bit names. Tables 2–5 show the various functions within the conversion register, setup register, averaging register, and reset register.

Table 1. Input Data Byte (MSB First)

REGISTER NAME	BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
Conversion	1	CHSEL3	CHSEL2	CHSEL1	CHSEL0	SCAN1	SCAN0	X
Setup	0	1	CKSEL1	CKSEL0	REFSEL1	REFSEL0	X	X
Averaging	0	0	1	AVGON	NAV1	NAV0	NSCAN1	NSCAN0
Reset	0	0	0	1	RESET	X	X	X

X = Don't care.

TERRANOLOGIC

User Manual EPT USB PLD Dev System

11.5 Conversion Register

Select active analog input channels per scan and scan modes by writing to the conversion register. Table 2 details channel selection and the four scan modes.

Request a scan by writing to the conversion register when in clock mode 10 or 11, or by applying a low pulse to the CNVST pin when in clock mode 00 or 01.

A conversion is not performed if it is requested on a channel that has been configured as CNVST. Select scan mode 00 or 01 to return one result per single-ended channel within the requested range. Select scan mode 10 to scan a single input channel numerous times, depending on NSCAN1 and NSCAN0 in the averaging register (Table 4). Select scan mode 11 to return only one result from a single channel.

Table 2. Conversion Register*

BIT NAME	BIT	FUNCTION
—	7 (MSB)	Set to 1 to select conversion register.
CHSEL3	6	Analog input channel select.
CHSEL2	5	Analog input channel select.
CHSEL1	4	Analog input channel select.
CHSEL0	3	Analog input channel select.
SCAN1	2	Scan mode select.
SCAN0	1	Scan mode select.
—	0 (LSB)	Don't care.

TERRANOLOGIC

User Manual EPT USB PLD Dev System

CHSEL1	CHSEL0	SELECTED CHANNEL (N)	SCAN1	SCAN0	SCAN MODE (CHANNEL N IS SELECTED BY BITS CHSEL3–CHSEL0)
0	0	AIN0	0	0	Scans channels 0 through N.
0	1	AIN1	0	1	Scans channels N through the highest numbered channel.
1	0	AIN2	1	0	Scans channel N repeatedly. The averaging register sets the number of results.
1	1	AIN3	1	1	No scan. Converts channel N once only.

11.6 Setup Register

Write a byte to the setup register to configure the clock, reference, and power-down modes. Table 3 details the bits in the setup register. Bits 5 and 4 (CKSEL1 and CKSEL0) control the clock mode, acquisition and sampling, and the conversion start. Bits 3 and 2 (REFSEL1 and REFSEL0) control internal or external reference use.

TERRANOLOGIC

User Manual EPT USB PLD Dev System

Table 3. Setup Register*

BIT NAME	BIT	FUNCTION
—	7 (MSB)	Set to zero to select setup register.
—	6	Set to 1 to select setup register.
CKSEL1	5	Clock mode and $\overline{\text{CNVST}}$ configuration. Resets to 1 at power-up.
CKSEL0	4	Clock mode and $\overline{\text{CNVST}}$ configuration.
REFSEL1	3	Reference mode configuration.
REFSEL0	2	Reference mode configuration.
—	1	Don't care.
—	0 (LSB)	Don't care.

*See below for bit details.

CKSEL1	CKSEL0	CONVERSION CLOCK	ACQUISITION/SAMPLING	$\overline{\text{CNVST}}$ CONFIGURATION
0	0	Internal	Internally timed	$\overline{\text{CNVST}}$
0	1	Internal	Externally timed through $\overline{\text{CNVST}}$	$\overline{\text{CNVST}}$
1	0	Internal	Internally timed	AIN15/AIN11/AIN7**
1	1	External (4.8MHz max)	Externally timed through SCLK	AIN15/AIN11/AIN7**

**For the MAX11618/MAX11619, $\overline{\text{CNVST}}$ has its own dedicated pin.

REFSEL1	REFSEL0	VOLTAGE REFERENCE	AutoShutdown
0	0	Internal	Reference off after scan; need wake-up delay.
0	1	External single ended	Reference off; no wake-up delay.
1	0	Internal	Reference always on; no wake-up delay.
1	1	Reserved	Reserved. Do not use.

11.7 Averaging Register

Write to the averaging register to configure the ADC to average up to 32 samples for each requested result, and to independently control the number of results requested for single-channel scans. Table 2 details the four scan modes available in the conversion register. All four scan modes allow averaging as long as the AVGON bit, bit 4 in the averaging register, is set to 1.

TERRANOLOGIC

User Manual EPT USB PLD Dev System

Select scan mode 10 to scan the same channel multiple times. Clock mode 11 disables averaging.

Table 4. Averaging Register*

BIT NAME	BIT	FUNCTION
—	7 (MSB)	Set to 0 to select averaging register.
—	6	Set to 0 to select averaging register.
—	5	Set to 1 to select averaging register.
AVGON	4	Set to 1 to turn averaging on. Set to zero to turn averaging off.
NAV1	3	Configures the number of conversions for single-channel scans.
NAV0	2	Configures the number of conversions for single-channel scans.
NSCAN1	1	Single-channel scan count. (Scan mode 10 only.)
NSCAN0	0 (LSB)	Single-channel scan count. (Scan mode 10 only.)

*See below for bit details.

AVGON	NAV1	NAV0	FUNCTION
0	X	X	Performs 1 conversion for each requested result.
1	0	0	Performs 4 conversions and returns the average for each requested result.
1	0	1	Performs 8 conversions and returns the average for each requested result.
1	1	0	Performs 16 conversions and returns the average for each requested result.
1	1	1	Performs 32 conversions and returns the average for each requested result.

X = Don't care.

NSCAN1	NSCAN0	FUNCTION (APPLIES ONLY IF SCAN MODE 10 IS SELECTED)
0	0	Scans channel N and returns 4 results.
0	1	Scans channel N and returns 8 results.
1	0	Scans channel N and returns 12 results.
1	1	Scans channel N and returns 16 results.

11.8 Reset Register

Write to the reset register (as shown in Table 5) to clear the FIFO or to reset all registers to their default states. Set the RESET bit to 1 to reset the FIFO. Set the reset bit to zero to return the MAX11618 to the default power-up state.

Table 5. Reset Register

BIT NAME	BIT	FUNCTION
—	7 (MSB)	Set to 0 to select reset register.
—	6	Set to 0 to select reset register.
—	5	Set to 0 to select reset register.
—	4	Set to 1 to select reset register.
RESET	3	Set to zero to reset all registers. Set to 1 to clear the FIFO only.
X	2	Don't care.
X	1	Don't care.
X	0 (LSB)	Don't care.

12 MAXV Programming

The UnoMax uses the second channel of the FT2232H chip as a dedicated CPLD programming port. The CPLD must be programmed via JTAG signals and the FT2232H has built in JTAG signals.

13 Oscillator

There is a 66MHz oscillator on the UnoProLogic, This oscillator has the following Vendor and

P/N

1. 66MHz, Renesas Electronics America Inc; P/N: XLH536066.000000I

This oscillators are connected to the Global Clock inputs on the FPGA. Both devices provide stable clock for the FPGA's internal DLL's. The user can access these clock sources by calling the net connected to the FPGA pin.

Component	Net Name	Pin on CPLD	Signal in EPT Project Pinout	
66MHz Osc	GCLK1	23	CLK_66MHZ	

TERRANOLOGIC

XLH536066.000000I

PARAMETERS	MAX (unless otherwise noted)
Frequency	66MHz
Supply Voltage (VDD)	3.3V
Input Current (IDD) >50.000 ~ 67.000MHz	25 mA
Standby Current	10 μ A
Output Symmetry (50% VDD) >50.000 ~ 170.000MHz	40% ~ 60%
Rise/Fall Time (10%/90% VDD Levels) (TR/TF) 1.000 ~ 80.000MHz	6 nS
Output Voltage (VOL) (VOH)	10% VDD 90% VDD Min
Output Load (HCMOS)	15 pF
Start-up Time (TS)	10 mS
Frequency Stability	± 25 ppm
Operating Temperature	-40°C ~ 85°C

14 USB to Serial

The FT2232HQ is a USB 2.0 High Speed (480Mb/s) to UART/MPSSE IC. The device features two interfaces that can be configured for asynchronous or synchronous serial or parallel FIFO interfaces. The two channels can also be independently configured to use an MPSSE engine.

This allows the two ports of the FT2232HQ to operate independently as UART/Bit-Bang ports or MPSSE engines used to emulate JTAG, SPI, I2C, Bit-bang or other synchronous serial modes.

The chip is powered by +3.3V and includes an internal +1.8V regulator to power the chip core. It uses +3.3V I/O interfacing and is +5V Tolerant. Operational configuration mode and USB Description strings configurable in external EEPROM over the USB interface. Asynchronous serial UART interface option with full hardware handshaking and modem interface signals. Fully assisted hardware or X-On / X-Off software handshaking. UART Interface supports 7/8 bit data, 1/2 stop bits, and Odd/Even/Mark/Space/No Parity.

15 UnoProLogic Power

The UnoProLogic can be powered from the USB bus of a Host/PC or the optional barrel connector. The USB supplies a maximum of +5V @ 500mA's. The components of the UnoProLogic must share this power with the user code that will run inside the FPGA along with any external power use.
