Terranologic, Inc

UnoProLogic USB-CPLD DEVELOPMENT SYSTEM User Manual

The UnoProLogic development system provides an innovative method of developing and debugging programmable logic code. It also provides a high speed data transfer mechanism between an Arduino board and a host PC. The UnoProLogic development system provides a convenient, user-friendly work flow by connecting seamlessly with Altera's Quartus Prime software. The user will develop the code in the Quartus environment on a Windows Personal Computer. The programmable logic code is loaded into the CPLD using only the Quartus Programmer tool and a standard USB-C cable. The Active Host SDK provides a highly configurable communications interface between Arduino and host. It connects transparently with the Active Transfer Library in the CPLD code. This Active Host/Active Transfer combination eliminates the complexity of designing a USB communication system. No scheduling USB transfers, USB driver interface or inf file changes are needed. The UnoProLogic development system is a unique combination of hardware and software.

TERRANOLOGIC

USB CPLD Development System User Manual

1 Introduction and General Description

The Terranologic UnoProLogic USB-CPLD development system hardware consists of a High Speed USB to parallel bus chip and a CPLD. The USB interface provides both JTAG programming of the CPLD and a serial transfer path. The software consists of the Active Host SDK for the PC. The firmware includes the Active Transfer Library which is used in the CPLD to provide advanced functions for control and data transfer to/from the Arduino.

THE EARTH PEOPLE TECHNOLOGY USB-CPLD DEVELOPMENT SYSTEM

The user's Arduino code is developed to perform particular functions required by the user (such as reading a temperature sensor). The code is downloaded to the microcontroller using the Arduino IDE system provided as part of the microcontroller development system. The UnoProLogic Development System allows users to write HDL code (either Verilog or VHDL) that will implement any digital logic circuit. The user's HDL code is compiled and synthesized and packaged into a programming file. The programming file is programmed into the CPLD using the JTAG channel of the USB to Serial chip, the FT2232H. The Active Host SDK contains a dll which maintains device connection, polling, writes and includes a unique receive mechanism that

TERRANOLOGIC

USB CPLD Development System User Manual

automatically transfers data from UnoProLogic when data is ready. It also alerts the user code when the dll has stored the transfer and the data is available to the software GUI (graphical user interface). Users do not need to interface with the USB Host Driver or any Windows drivers. They need only to include the Active Host dll in their projects. The Active Transfer Libraries must be included in the CPLD project to take advantage of the configurability of the Active Host SDK. All of the drivers, libraries, and project source code are available at www.earthpeopletechnology.com.

1.1 Test Driving the Active Host Test Application

The UnoProLogic board comes pre-loaded with the EPT_Transfer_Test HDL project in the CPLD. This project allows the user to test out the functions of the Active Host API and the board hardware.

To test drive the application, connect the UnoProLogic to the Windows PC using Type A to USB-C cable. Load the driver for the board. See the section EPT Drivers for instructions on loading the UnoProLogic driver. If the USB driver fails to load, the Windows OS will indicate that no driver was loaded for the device.

TERRANOLOGIC

USB CPLD Development System User Manual

Next, open a Windows Explorer browser. Browse to the Projects_ActiveHost_64Bit\EPT_Transfer_Test\EPT_Transfer_Test\bin\x64\Debug\ folder on the UNO_USB_CPLD_PROJECT_DVD. The application should load with a Windows form.

TERRANOLOGIC

USB CPLD Development System User Manual

With the application loaded, select the EPT Serial Communications x board from the dropdown combo box.

TERRANOLOGIC

USB CPLD Development System User Manual

Next, click on the Open button.

TERRANOLOGIC

USB CPLD Development System User Manual

The “Device Connected” label should be seen to indicate the Windows App is now connected to the UnoProLogic.

TERRANOLOGIC

USB CPLD Development System User Manual

Click on one of the LED buttons in the middle of the window. The corresponding LED on the UnoProLogic board should light up.

TERRANOLOGIC

USB CPLD Development System User Manual

Click on the Blinky button for a light show.

TERRANOLOGIC

USB CPLD Development System User Manual

To exercise the Single Byte Transfer EndTerm, click the “Byte” button in the Transfer Controls group. Type in several numbers separated by a space and less 256 into the Multiple Byte textbox. Then hit the Multi Byte button. The numbers appear in the Receive Byte textbox.

TERRANOLOGIC

USB CPLD Development System User Manual

To exercise the Block Transfer EndTerm, click the “Start” button in the GPIO Controls group. The UnoProLogic will sample the state of each Input pin of the CPLD that is connected to a board edge connector. The Transfer Test Window will display the results of each pin, Hi or Lo

TERRANOLOGIC

USB CPLD Development System User Manual

The results of each pin are displayed next to the image of the UnoProLogic in separate buttons.

TERRANOLOGIC

USB CPLD Development System User Manual

Press the PCB switches on the UnoProLogic to view the Switch Controls in action.

TERRANOLOGIC

USB CPLD Development System User Manual

1.2 EPT-5M57-AP-U2

The UnoProLogic board is equipped with an Intel 5M570 CPLD; which is programmed using the Intel Quartus Prime software. The CPLD has 570 Logic Elements which is equivalent to 440 Macrocells. An on board 66 MHz oscillator is used by the EPT Active Transfer Library to provide data transfer rates of up to 0.1 Mega Bytes per second. Twenty Four I/O's from the CPLD are attached to three 8 bit transceivers to provide 5 Volt compatible I/O's. These 74LVC245 bidirectional voltage translator/bus transceivers are controlled by one enable and direction bit per transceiver. This means the direction of the individual bits of each transceiver cannot be selected; the direction is selected for all eight bits per transceiver. There are four RGB LED's, two Slide Switches and two Push Buttons that are controllable by the user code. The hardware features are as follows.

- Intel 5M570 CPLD with 440 Macrocells
- FT2232H USB to Serial Interface chip
- 4 Channel ADC 300KSamples/Second
- 66 MHz oscillator for driving USB data transfers and users code
- Three bidirectional voltage translator/bus transceivers

TERRANOLOGIC

USB CPLD Development System User Manual

- 24 user Input/Outputs available as three 8 bit ports
- Ports have jumper selectable 3.3V/5 Volt Input/Output
- Four RGB LED's accessible by the user
- Two PCB switches accessible by the user
- Two Slide Switches
- Two PMOD Connectors
- All I/O connectors stack into the Arduino Uno

TERRANOLOGIC

USB CPLD Development System User Manual

UnoProLogic

1.2.1 Serial USB Communications

The UnoProLogic CPLD Development system connects an FT2232H Dual High Speed USB (480 Mbits/sec) chip to the CPLD. The CPLD uses a dedicated channel on the FT2232H for serial transfers to the PC. Using the EPT Active Transfer Library, sustained speeds of 0.1 Mbytes/sec can be achieved. The transfers are bi-directional.

TERRANOLOGIC

USB CPLD Development System User Manual

The FT2232H chip provides a means of data conversion from USB to serial data and serial to USB for data being sent from the CPLD to the PC. Channel A is configured as a JTAG bus and Channel B is configured as a single COM Port. Channel B has one dual port 4Kbyte FIFO for transmission from Host PC to the CPLD.

The Serial Communications with the UnoProLogic is handled easily using the Active Host API. The Active Host SDK is provided as a dll which easily interfaces to application software written in C#, C++ or C. It runs on the PC and provides transparent connection

from PC application code through the USB driver to the user CPLD code. The user code connects to “Endterms” in the Active Host dll. These Host “Endterms” have complementary HDL “Endterms” in the Active Transfer Library. Users have seamless bi-directional communications at their disposal in the form of:

- Trigger Endterm
- Transfer Endterm
- Block Endterm

TERRANOLOGIC

USB CPLD Development System User Manual

User code writes to the Endterms as function calls. Just include the address of the individual module (there are eight individually addressable modules of each Endterm). Immediately after writing to the selected Endterm, the value is received at the HDL Endterm in the CPLD.

1.2.2 Host PC Connection

The UnoProLogic includes an LED that signifies the connection of the board with the Host PC. The connect LED has the word “CONNECT” in silkscreen next to the LED. This LED will only light up once the Host PC has correctly enumerated the USB device (FT2232HQ chip). When this LED is lit up it can tell the user three things:

- Power has been applied to the UnoProLogic via USB
- The FT2232HQ chip is working properly
- The Host PC has found the appropriate driver and will communicate with the UnoProLogic

CONNECT LED

1.2.3 PMOD Connectors

The UnoProLogic includes two PMOD Connectors. These two connectors are located towards the rear of the board.

TERRANOLOGIC

USB CPLD Development System User Manual

The PMOD pinouts follows the standard pinout. Pin 1 is located in the upper right when facing the connector.

VCC is +3.3V and the Inputs and Outputs of the 8 signals are +3.3V only. The eight I/O's are connected directly to FPGA pins and can be designated as any communications standard.

TERRANOLOGIC

USB CPLD Development System User Manual

PMOD

The PMOD have the following connections to the MAX V chip:

PMOD Pin Number	Signal Name	MAX V Pin Number
1-1	PMOD_1_1	83
1-2	PMOD_1_2	81
1-3	PMOD_1_3	77
1-4	PMOD_1_4	58
1-7	PMOD_1_7	76
1-8	PMOD_1_8	78
1-9	PMOD_1_9	82
1-10	PMOD_1_10	84
2-1	ADC_AIN0	NA
2-2	ADC_AIN1	NA
2-3	ADC_AIN2	NA
2-4	ADC_AIN3	NA
2-7	PMOD_2_7	76
2-8	PMOD_2_8	78
2-9	PMOD_2_9	82
2-10	PMOD_2_10	84

1.2.4 Inputs and Outputs

There are 24 Inputs/Outputs which are selectable between +3.3V and +5 Volt. JMP1 is used to select which voltage the 24 Inputs/Outputs are set to.

TERRANOLOGIC

USB CPLD Development System User Manual

The I/O's are organized as three 8 bit directional ports. Each port must be defined as input or output. This means that all 8 bits of a port will point in the same direction, depending on the direction bit of the transceiver. The direction bit can be changed at any time, so that a port can change from input to output in minimum setup time of 6 nanoseconds. Each port also has an enable pin. This enable pin will enable or disable the bits of the port. If the port is disabled, the bits will “float”.

TERRANOLOGIC

USB CPLD Development System User Manual

TRANSCIEVERS PROVIDE PROTECTION FROM OVERVOLTAGE/
OVERCURRENT BETWEEN USER HEADERS AND CPLD I/O's

1.2.5 User LEDs

The User LEDs are four RGB LEDs. These LEDs are SML-LX0404 chips and are for use only with +3.3V.

TERRANOLOGIC

USB CPLD Development System User Manual

The SML-LX0404 chip is a current sink and are connected to pins on the MAX V CPLD. The anode is connected to +3.3V. The series resistors are calculated for current limiting based on +3.3V.

Each series resistor uses a 220 Ohm in a resistor array. In order to light up the each LED, the user code must assert a zero on the associated signal for the LED. To turn off the LED, assert High Z on the signal.

The LED RGB signals are organized on the following pins from the MAX V chip:

LED Number	Signal Name	MAX V Pin Number
------------	-------------	------------------

TERRANOLOGIC

USB CPLD Development System User Manual

D1	LED GREEN 1 N	57
D1	LED BLUE 1 N	56
D1	LED RED 1 N	55
D2	LED GREEN 2 N	54
D2	LED BLUE 2 N	53
D2	LED RED 2 N	52
D3	LED GREEN 3 N	51
D3	LED BLUE 3 N	50
D3	LED RED 3 N	49
D4	LED GREEN 4 N	48
D4	LED BLUE 4 N	47
D4	LED RED 4 N	43

1.2.6 User Push Buttons

The UnoProLogic includes two push button switches. Both are momentary contact switches. They include a 1uF cap to ground to debounce both switches.

TERRANOLOGIC

USB CPLD Development System User Manual

Component	Net Name	Pin on CPLD	Signal in EPT Project Pinout
SW1	SW_USER_1	20	SW_USER_1
SW2	SW_USER_2	21	SW_USER_2

1.2.7 Slide Switches

The UnoProLogic includes two slide switches. Both are full contact switches. They include a 1uF cap to ground to debounce both switches.

TERRANOLOGIC

USB CPLD Development System User Manual

Component	Net Name	Pin on CPLD	Signal in EPT Project Pinout
SW3	SLIDE SWITCH 1	16	SLIDE SWITCH 1
SW4	SLIDE SWITCH 2	17	SLIDE SWITCH 2

TERRANOLOGIC

USB CPLD Development System User Manual

1.2.8 Analog Inputs

The UnoProLogic includes a six pin analog input connector. This connector provides a path from the pins to the input of the four Op-Amp buffers. Each Op-Amp includes a 1MHz low pass filter. Each Op-Amp provides a buffer for the analog signals to the ADC inputs.

1.2.9 JTAG

The UnoProLogic uses the second channel of the FT2232H chip as a dedicated CPLD programming port. The CPLD must be programmed via JTAG signals and the FT2232H has built in JTAG signals. The CPLD can be programmed directly from Quartus Prime Lite by using the “jtag_hw_mbftdi_blaster.dll”. Just click on the Programmer button and select the EPT-Blaster.

TERRANOLOGIC

USB CPLD Development System User Manual

1.3 Active Host EndTerms

The Active Host SDK is provided as a dll which easily interfaces to application software written in C#, C++ or C. It runs on the PC and provides transparent connection

from PC application code through the USB driver to the user CPLD code. The user code connects to “Endterms” in the Active Host dll. These Host “Endterms” have complementary HDL “Endterms” in the Active Transfer Library. Users have seamless bi-directional communications at their disposal in the form of:

- Trigger Endterm
- Transfer Endterm
- Block Endterm

User code writes to the Endterms as function calls. Just include the address of the individual module (there are eight individually addressable modules of each Endterm). Immediately after writing to the selected Endterm, the value is received at the HDL Endterm in the CPLD.

Receiving data from the CPLD is made simple by Active Host. Active Host transfers data from the CPLD as soon as it is available. It stores the transferred data into circular buffer. When the transfer is complete, Active Host invokes a callback function which is registered in the users application. This callback function provides a mechanism to transparently receive data from the CPLD. The user application does not need to schedule a read from the USB or call any blocking threads.

1.4 Active Transfer EndTerms

The Active Transfer Library is a portfolio of HDL modules that provides an easy to use yet powerful USB transfer mechanism. The user HDL code communicates with EndTerms in the form of modules. These EndTerm modules are commensurate with the

TERRANOLOGIC

USB CPLD Development System User Manual

Active Host EndTerms. There are three types of EndTerms in the Active Transfer Library:

- Trigger Endterm
- Transfer Endterm
- Block Endterm

They each have a simple interface that the user HDL code can use to send or receive data across the USB. Writing to an EndTerm will cause the data to immediately arrive

at the commensurate EndTerm in the Active Host/user application. The transfer through the USB is transparent. User HDL code doesn't need to set up Endpoints or respond to Host initiated data requests. The whole process is easy yet powerful.

2 EPT Drivers

The UnoProLogic Development system requires drivers for any interaction between PC and the board. The communication between the two consists of programming the CPLD and data transfer. In both cases, the USB Driver is required. This will allow Windows to recognize the USB Chip and setup a pathway for Windows to communicate with the USB hardware.

TERRANOLOGIC

USB CPLD Development System User Manual

2.1 USB Driver

The UnoProLogic uses an FTDI FT2232H USB to Serial chip. This chip provides the USB interface to the PC and the serial/FIFO interface to the CPLD. The FT2232H requires the use of the EPT USB driver. To install the driver onto your PC, use the CDM212xxx Folder. The installation of the FTDI 2.12.28 driver is easily accomplished by double clicking the CDM21228_Setup.exe.

Locate the CDM212xxx folder in the Drivers folder of the UnoProLogic Development System CD using Windows Explorer.

TERRANOLOGIC

USB CPLD Development System User Manual

Double click on the *.exe file and select the default settings when the software tool queries the user.

Plug in the UnoProLogic device into an available USB port.

Windows will attempt to locate a driver for the USB device. When it does not find one, it will report a error, “Device driver software was not successfully installed”. Ignore this error.

If Windows cannot load a driver for the DPL, a notification window will inform the user that the driver load has failed for the device.

TERRANOLOGIC

USB CPLD Development System User Manual

If the driver is successfully installed, Windows will inform the user. The user can check Device Manager to ensure the correct driver was installed for the UnoProLogic. The UnoProLogic will show up as two COM Ports under the “Ports (COM & LPT)” under the Device Manager.

TERRANOLOGIC

USB CPLD Development System User Manual

When this is complete, the drivers are installed and the UnoProLogic can be used for programming and USB data transfers.

2.2 JTAG DLL Insert to Quartus Prime Lite

The JTAG DLL Insert to Quartus Prime Lite allows the Programmer Tool under Quartus to recognize the UnoProLogic. The UnoProLogic can then be selected and perform programming of the CPLD. The file, `jtag_hw_mbftdi_blaster.dll` must be placed into the folder that hosts the `jtag_server` for Quartus.

2.2.1 Installing Quartus

You can download the Quartus Prime Lite by following the directions in the Section Downloading Quartus.

If you don't need to download Quartus, double click on the `QuartusLiteSetup-xxx.xxx.xxx-windows.exe` (the xxx is the build number of the file, it is subject to change). The Quartus Prime Web Edition will start the installation process.

TERRANOLOGIC

USB CPLD Development System User Manual

When the install shield window pops up click “Yes” or if needed, enter the administrator password for the users PC. Click “Ok”

Next, skip the “Download Quartus” section. Go down to the “Quartus Installer” section to complete the Quartus installation.

TERRANOLOGIC

USB CPLD Development System User Manual

2.2.2 Downloading Quartus

The first thing to do in order build a project in Quartus is to download and install the application. You can find the latest version of Quartus at:

[Intel FPGA Quartus Prime Lite](#)

You will first need to apply for an account with Intel. Then use your login and password to access the download site. Click on the Download Windows Version.

Quartus Prime Lite Edition
Release date: June, 2020
Latest Release: v20.1

Intel® Quartus® Prime
Design Software

Select edition: Lite
Select release: 20.1

Operating System Windows Linux

✓ The Quartus Prime Lite Edition Design Software, Version 20.1 includes functional and security updates. Users should keep their software up-to-date and follow the [technical recommendations](#) to help improve security. Additional security updates are planned and will be provided as they become available. Users should promptly install the latest version upon release.

✓ The Quartus Prime Lite Edition Design Software, Version 20.1 is subject to removal from the web when support for all devices in this release are available in a newer version, or all devices supported by this version are obsolete. If you would like to receive customer notifications by e-mail, please subscribe to our [subscribe to our customer notification mailing list](#).

The next page will require you to sign into your “myAltera” account. If you do not have one, follow the directions under the box, “Don’t have an account?”

TERRANOLOGIC

2.2.4 Adding the EPT_Blaster to Quartus Prime

Close out the Quartus Prime application.

To program the UnoProLogic FPGA, the Terranologic USB Blaster *.dll must be added to the quartus64/bin folder of the root of the Quartus installation. Terranologic has an automated installer that will add the *.dll to the appropriate location.

To access the Terranologic USB Blaster Installer, goto www.terranelogic.com website. Click on “Products” in the Banner

TERRANOLOGIC

USB CPLD Development System User Manual

Click on “UnoProLogic” under products

Locate the “Downloads” at the bottom of the page.

To use the Active Host Application Software, the Active Host DLL and the ftd2xx DLL must be included in the Microsoft Visual project. The Active Host Application Software will allow the user to create a custom applications on the PC using the EndTerms to perform Triggers and Data Transfer to/from the UnoProLogic. The methods and parameters of the Active Host DLL are explained in the Active Host Application section. Locate the \Projects_ActiveHost_64Bit and \Projects_ActiveHost_32Bit folders on the UnoProLogic Development System CD.

TERRANOLOGIC

USB CPLD Development System User Manual

Locate the Projects_ActiveHost_64Bit in the UnoProLogic Development System using Windows Explorer.

Locate the Projects_ActiveHost_64Bit \ActiveHost_1.0.0.8\Bin folder and copy the ActiveHost64.dll and the ftd2xx64.dll.

TERRANOLOGIC

USB CPLD Development System User Manual

Save the DLL's in the bin\x64\Release folder of the user project under the Microsoft C# Express project. See the Active Host Application section of the UnoProLogic Development System User Manuals for instructions on how to add the dll to the Microsoft C# Express project.

3 Active Transfer Library

The Active Transfer Library is an HDL library designed to transfer data to and from the UnoProLogic via High Speed (480 MB/s) USB. It is a set of pre-compiled HDL files that the user will add to their project before building it. The description of what the library does and how to use its components are described in this manual.

TERRANOLOGIC

USB CPLD Development System User Manual

3.1 EPT Active Transfer System Overview

The Active Transfer System components consist of the following:

- active_serial_library.v
- ft_245_state_machine.v
- endpoint_registers.vqm
- active_trigger.v
- active_transfer.v
- active_block.v

The Active_Serial_Library provides the communication to the USB hardware. While separate Input and Output buses provide bi-directional communications with the plug in modules. See Figure 6 for an overview of the EPT Active_Transfer system.

Figure 6 EPT Active Transfer Library Overview

Figure 6 shows how the modules of the EPT Active Transfer Library attach to the overall user project. The EPT Active_Transfer_Library.vqm, Active_Trigger.v,

TERRANOLOGIC

USB CPLD Development System User Manual

Active_Transfer.v and Active_Block.v modules are instantiated in the top level of the user project. The User_Code.v module is also instantiated in the top level. The Active_Transfer modules communicate with the User_Code through module parameters. Each module is a bi-directional component that facilitates data transfer from PC to CPLD. The user code can send a transfer to the Host, and the Host can send a transfer to the user code. This provides significant control for both data transfers and signaling from the user code to PC. The Triggers are used to send momentary signals that can turn on (or off) functions in user code or PC. The Active Transfer is used to send a single byte. And the Active Block is used to send a block of data. The Active_Transfer and Active_Block modules have addressing built into them. This means the user can declare up to 8 individual instantiations of Active_Transfer or Active_Block, and send/receive data to each module separately.

3.2 Active Transfer Library

The Active Transfer Library contains the command, control, and data transfer mechanism that allows users to quickly build powerful communication schemes in the CPLD. Coupled with the Active Host application on the PC, this tools allows users to focus on creating programmable logic applications and not have to become distracted by USB Host drivers and timing issues. The Active Transfer Library is pre-compiled file that the user will include in the project files.

The interface from the library to the user code is two uni directional buses, UC_IN[22:0] and UC_OUT[20:0]. The UC_IN[22:0] bus is an output bus (from the library, input bus to the Active Modules) that is used channel data, address, length and control information to the Active Modules. The UC_OUT[21:0] bus is an input bus (to the library, output bus from the Active Modules) that is used to communicate data, address, length, and control information to the Active Modules.

578 //
579 //
```

The control bus UART_IN and UART_OUT are used to channel data, and control signals to the USB interface chip. These signals are connected directly to input and output pins of the CPLD.

3.2.1 Active Trigger EndTerm

The Active Trigger has eight individual self resetting, active high, signals. These signals are used to send a momentary turn on/off command to Host/User code. The Active Trigger is not addressable so the module will be instantiated only once in the top level.

TERRANOLOGIC

USB CPLD Development System User Manual

```
743 wire [22*3-1:0] uc_out_m;  
744 eptWireOR # (.N(3)) wireOR (UC_OUT, uc_out_m);  
745 active_trigger ACTIVE_TRIGGER_INST  
746 (   
747     .uc_clk          (CLK_66),  
748     .uc_reset        (RST),  
749     .uc_in           (UC_IN),  
750     .uc_out          (uc_out_m[ 0*22 +: 22 ]),  
751   
752     .trigger_to_host (trigger_to_host),  
753     .trigger_to_device (trigger_in_byte)  
754   
755 );  
756
```

To send a trigger, decide which bit (or multiple bits) of the eight bits you want to send the trigger on. Then, set that bit (or bits) high. The Active Transfer Library will send a high on that trigger bit for one clock cycle (66 MHz), then reset itself to zero. The bit can stay high on the user code and does not need to be reset to zero. However, if the user sends another trigger using the trigger byte, then any bit that is set high will cause a trigger to occur on the Host side.

TERRANOLOGIC

USB CPLD Development System User Manual

```
277 //-----
278 // Detect Trigger Out to Host
279 //-----
280 always @(TRIGGER_OUT or trigger_in_reset or reset)
281 begin
282     if(!reset)
283         trigger_to_host = 8'h0;
284     else if (trigger_in_reset)
285         trigger_to_host = 8'h0;
286     else if (TRIGGER_OUT > 8'h0)
287         trigger_to_host = TRIGGER_OUT;
288 end
289
290 //-----
291 // Reset Trigger Out to Host
292 //-----
293 always @(posedge CLK_66 or negedge reset)
294 begin
295     if(!reset)
296     begin
297         trigger_in_reset <= 0;
298     end
299     else
300     begin
301         if (trigger_to_host > 0)
302             trigger_in_reset <= 1'b1;
303         else
304             trigger_in_reset <= 0;
305     end
306 end
```

So, care should be used if the user code uses byte masks to send triggers. It is best to set only the trigger bits needed for a given time when sending triggers.

The user code must be setup to receive triggers from the Host. This can be done by using an asynchronous always block. Whenever a change occurs on a particular trigger bit (or bits), a conditional branch can detect if the trigger bit is for that block of code. Then, execute some code based on that trigger.

351             trigger_in_reg <= 1'b0;
```

TERRANOLOGIC

USB CPLD Development System User Manual

3.2.2 Active Transfer EndTerm

The Active Transfer module is used to send or receive a byte to/from the Host. This is useful when the user's microcontroller needs to send a byte from a measurement to the Host for display or processing. The Active Transfer module is addressable, so up to eight individual modules can be instantiated and separately addressed.

```

757 active_transfer      ACTIVE_TRANSFER_INST
758 (
759     .uc_clk           (CLK_66),
760     .uc_reset         (reset),
761     .uc_in            (UC_IN),
762     .uc_out           (uc_out_m[ 1*22 +: 22 ]),
763
764     .start_transfer   (transfer_out_reg),
765     .transfer_received (transfer_in_received),
766
767     .uc_addr          (3'h2),
768
769     .transfer_to_host  (transfer_out_byte),
770     .transfer_to_device (transfer_in_byte)
771 );
772

```

To send a byte to the Host, select the appropriate address that corresponds to an address on Host side. Place the byte in the “transfer_to_host” parameter, then strobe the “start_transfer” bit. Setting the “start_transfer” bit to high will send one byte from the “transfer_to_host” byte to the Host on the next clock high signal (66 MHz). The “start_transfer” bit can stay high for the duration of the operation of the device, the Active Transfer module will not send another byte. In order to send another byte, the user must cycle the “start_transfer” bit to low for a minimum of one clock cycle (66 MHz). After the “start_transfer” bit has been cycled low, the rising edge of the bit will cause the byte on the “transfer_to_host” parameter to transfer to the host.

TERRANOLOGIC

USB CPLD Development System User Manual

```
181 //-----
182 // Transfer byte to Device
183 //-----
184 always @(TRANSFER_OUT_EN or reset)
185 begin
186     if(!reset)
187     begin
188         transfer_out_detect = 1'b0;
189     end
190     else
191     begin
192         if(transfer_to_device_reset)

216             transfer_to_device_reset <= 1'b0;
217     end
218 end
```

TERRANOLOGIC

USB CPLD Development System User Manual

To receive a byte, the Active Host will send a byte using it's dll. The user code must monitor the transfer_received port. The transfer_received port will assert high for one clock cycle (66 MHz) when a byte is ready for reading on the transfer_to_device port. User code should use an asynchronous always block to detect when the transfer_received port is asserted. Upon assertion, the user code should read the byte from the transfer_to_device port into a local register.

```

220 //-----
221 // Transfer to Host
222 //-----
223 always @(posedge CLK_66 or negedge reset)
224 begin
225     if (!reset)
226     begin
227         transfer_out <= 1'b0;
228         transfer_out_reg <= 1'b0;
229         transfer_out_byte <= 8'h0;
230     end
231     else
232     begin
233         if(start_transfer_byte & !transfer_out)
234         begin
235             transfer_out_byte <= TRANSFER_HOST_BYTE;
236             transfer_out_reg <= 1'b1;
237             transfer_out <= 1'b1;
238         end
239         else if(start_transfer_byte & transfer_out)
240         begin
241             transfer_out_reg <= 1'b0;
242             transfer_out <= 1'b1;
243         end
244         else if(!start_transfer_byte & transfer_out)
245         begin
246             transfer_out_reg <= 1'b0;
247             transfer_out <= 1'b0;
248         end
249     end
250 end

```

3.2.3 Active Block EndTerm

The Active Block module is designed to transfer blocks of data between Host and User Code and vice versa. This allows buffers of data to be transferred with a minimal

TERRANOLOGIC

USB CPLD Development System User Manual

amount of code. The Active Block module is addressable, so up to eight individual modules can be instantiated and separately addressed. The length of the block to be transferred must also be specified in the `uc_length` port.

```

811 active_block          BLOCK_TRANSFER_INST
812 (
813     .uc_clk             (CLK_66) ,
814     .uc_reset           (RST) ,
815     .uc_in              (UC_IN) ,
816     .uc_out             (uc_out_m[ 2*22 +: 22 ]),
817
818     .start_transfer      (block_out_reg) ,
819     .transfer_received   (block_in_rcv) ,
820
821     .transfer_ready      (block_byte_ready) ,
822
823     .uc_addr             (3'h4) ,
824     .uc_length           (BLOCK_COUNT_8) ,
825
826     .transfer_to_host    (block_out_byte) ,
827     .transfer_to_device  (block_in_data) ,
828
829     .STATE_OUT           (block_state_out) ,
830     .TEST_BUS            (block_out_test_bus)
831
832 );
833

```

To send a block, it's best to have buffer filled in a previous transaction, Then assert the `start_transfer` bit. This method is opposed to collecting and processing data bytes after the `start_transfer` bit has been asserted and data is being sent to the Host.

Once the buffer to send is filled with the requisite amount of data, the address and buffer length should be written to the `uc_addr` and `uc_length` ports. Set the `start_transfer` bit high, the user code should monitor the `transfer_ready` port. At the rising edge of the `transfer_ready` port, the byte at `transfer_to_host` port is transferred to the USB chip. Once this occurs, the user code should copy the next byte in the buffer to `transfer_to_host` port. On the next rising edge of `transfer-ready`, the byte at

TERRANOLOGIC

USB CPLD Development System User Manual

transfer_to_host will be transferred to the USB chip. This process continues until the number of bytes described by the uc_length have been transferred into the USB chip.

TERRANOLOGIC

586         end  
587     end  
588 end
```

TERRANOLOGIC

USB CPLD Development System User Manual

To receive a buffer from the Host, the user code should monitor the `transfer_received` port for assertion. When the bit is asserted, the next rising edge of `transfer_ready` will indicate that the byte at `transfer_to_device` is ready for the user code to read.

[Add code snippet showing Active Block Module bytes received by the user code]

3.3 Timing Diagram for Active Transfer EndTerms

The Active Transfer Library uses the 66 MHz clock to organize the transfers to Host and transfer to Device. The timing of the transfers depends on this clock and the specifications of the USB chip. Users should use the timing diagrams to ensure proper operation of user code in data transfer.

4 Compiling, Synthesizing, and Programming CPLD

The CPLD on the UnoProLogic can be programmed with the Active Transfer Library and custom HDL code created by the user. Programming the CPLD requires the use of the Quartus Prime software and a standard USB cable. There are no extra parts to buy, just plug in the USB cable. Once the user HDL code is written according to the syntax rules of the language (Verilog and VHDL) it can be compiled and synthesized using the Quartus Prime software. This manual will not focus on HDL coding or proper coding techniques, instead it will use the example code to compile, synthesize and program the CPLD.

4.1 Setting up the Project and Compiling

Once the HDL code (Verilog or VHDL) is written and verified using a simulator, a project can be created using Quartus Prime Lite. Writing the HDL code and simulating it will be covered in later sections. Bring up Quartus Prime Lite, then use Windows Explorer to browse to C:\Users\nelso\Documents\EPT_5M57_AP_U2_Transfer_Test to create a new directory called: “EPT_Transfer_Test”.

TERRANOLOGIC

USB CPLD Development System User Manual

Open Quartus Prime by clicking on the icon .

TERRANOLOGIC

USB CPLD Development System User Manual

Under Quartus, Select File->New Project Wizard. The Wizard will walk you through setting up files and directories for your project.

TERRANOLOGIC

USB CPLD Development System User Manual

At the Top-Level Entity page, browse to the C:\Users\<your name>\Documents\EPT_5M57_AP_U2_Transfer_Test\EPT_5M57_AP_U2_Top directory to store your project. Type in a name for your project “EPT_5M57_AP_U2_Top”.

TERRANOLOGIC

< Back Next > Finish Cancel Help

Select Next, leave defaults for the EDA Tool Settings.

TERRANOLOGIC

USB CPLD Development System User Manual

Select Next, then select Finish. You are done with the project level selections.

TERRANOLOGIC

USB CPLD Development System User Manual

Next, we will select the pins and synthesize the project.

4.1.1 Selecting Pins and Synthesizing

With the project created, we need to assign pins to the project. The signals defined in the top level file (in this case: EPT_5M57_AP_U2_Top.v) will connect directly to pins on the CPLD. The Pin Planner Tool from Quartus Prime will add the pins and check to verify that our pin selections do not violate any restrictions of the device. In the case of this example we will import pin assignments that created at an earlier time. Under Assignments, Select Import Assignments.

TERRANOLOGIC

USB CPLD Development System User Manual

At the Import Assignment dialog box, Browse to the
\\Projects_HDL\\EPT_Transfer_Test\\EPT_5M57_AP_U2_TOP folder of the
UnoProLogicDevelopment System DVD. Select the “EPT_5M57_AP_U2_Top.qsf”
file.

TERRANOLOGIC

USB CPLD Development System User Manual

Click Ok. Under Assignments, Select Pin Planner. Verify the pins have been imported correctly.

TERRANOLOGIC

USB CPLD Development System User Manual

The pin locations should not need to be changed for UnoProLogicDevelopment System. However, if you need to change any pin location, just click on the “location” column for the particular node you wish to change. Then, select the new pin location from the drop down box.

TERRANOLOGIC

USB CPLD Development System User Manual

Exit the Pin Planner. Next, we need to add the Synopsys Design Constraint file. This file contains timing constraints which forces the built in tool called TimeQuest Timing Analyzer to analyze the path of the synthesized HDL code with setup and hold times of the internal registers. It takes note of any path that may be too long to appropriately meet the timing qualifications. For more information on TimeQuest Timing Analyzer, see

https://ftp.intel.com/Public/Pub/fpgaup/pub/Teaching_Materials/current/Tutorials/VHDL/Timequest.pdf

TERRANOLOGIC

USB CPLD Development System User Manual

Browse to the \Projects_HDL\EPT_Transfer_Test\EPT_5M57_AP_U2_Top folder of the UnoProLogic Development System DVD. Select the “EPT_5M57_AP_U2_Top.sdc” file.

Copy the file and browse to C:\Users\nelso\Documents\EPT_5M57_AP_U2_Transfer_Test\EPT_5M57_AP_U2_Top directory. Paste the file.

Select the Start Compilation button.

TERRANOLOGIC

USB CPLD Development System User Manual

Then compilation will start.

TERRANOLOGIC

USB CPLD Development System User Manual

If you forget to include a file or some other error you should expect to see a screen similar to this:

Click on the “Processing” tab at bottom to see the error.

TERRANOLOGIC

USB CPLD Development System User Manual

The error in this case is the missing file “active_serial_library.v”. Click on the Assignment menu,

TERRANOLOGIC

USB CPLD Development System User Manual

then select Settings, then select Files. Add the “active_serial_library.v” file from the database.

TERRANOLOGIC

USB CPLD Development System User Manual

Click Ok then re-run the Compile process. After successful completion, the screen should look like the following:

TERRANOLOGIC

USB CPLD Development System User Manual

At this point the project has been successfully compiled, synthesized and a programming file has been produced. See the next section on how to program the CPLD.

4.1.2 Programming the CPLD

Programming the CPLD is quick and easy. All that is required is a standard USB-C cable and the EPT_Blaster Driver DLL. Connect the UnoProLogic to the PC, open up Quartus Prime, open the programmer tool, and click the Start button. To program the CPLD, follow the steps to install the USB Driver and the JTAG Driver Insert for Quartus Prime.

TERRANOLOGIC

USB CPLD Development System User Manual

If the project created in the previous sections is not open, open it. Click on the Programmer button.

The Programmer Window will open up with the programming file selected. Click on the Hardware Setup button in the upper left corner.

TERRANOLOGIC

USB CPLD Development System User Manual

The Hardware Setup Window will open. In the “Available hardware items”, double click on “EPT-Blaster v1.0”.

TERRANOLOGIC

USB CPLD Development System User Manual

If you successfully double clicked, the “Currently selected hardware:” dropdown box will show the “EPT-Blaster v1.0b”.

TERRANOLOGIC

USB CPLD Development System User Manual

Click on the Auto-Detect button. This will verify that the EPT-Blaster driver can connect with the UnoProLogic device.

TERRANOLOGIC

USB CPLD Development System User Manual

Select the 5M570 under “Device”.

Click on the “Change File” button and browse to the output_files folder.

TERRANOLOGIC

USB CPLD Development System User Manual

Click on the EPT_5M57_AP_U2_Top.pof file to select it.

Click the Open button in the lower right corner.

Next, select the checkbox under the “Program/Configure” of the Programmer Tool. The checkboxes for the CFM and UFM will be selected automatically.

TERRANOLOGIC

USB CPLD Development System User Manual

Click on the Start button to to start programming the CPLD. The Progress bar will indicate the progress of programming.

TERRANOLOGIC

USB CPLD Development System User Manual

When the programming is complete, the Progress bar will indicate success.

TERRANOLOGIC

USB CPLD Development System User Manual

At this point, the UnoProLogic is programmed and ready for use. To test that the CPLD is properly programmed, bring up the Active Host Test Tool. Click on one of the LED's and verify that the LED selected lights up. Press one of the switches on the board and ensure that the switch is captured on the Active Host Test Tool. Now you are ready to connect to the Arduino Uno and write some code to transfer data between microcontroller and PC.

5 Active Host Application

The Active Host SDK is provided as a dll which easily interfaces to application software written in C#, C++ or C. It runs on the PC and provides transparent connection from PC application code through the USB driver to the user CPLD code. The user code connects to "Endterms" in the Active Host dll. These host "Endterms" have complementary HDL "Endterms" in the Active Transfer Library. Users have seamless bi-directional communications at their disposal in the form of:

- Trigger Endterm
- Transfer Endterm

TERRANOLOGIC

USB CPLD Development System User Manual

- **Block Endterm**

User code writes to the Endterms as function calls. Just include the address of the individual module (there are eight individually addressable modules of each Endterm). Immediately after writing to the selected Endterm, the value is received at the HDL Endterm in the CPLD. The Trigger Endterms are used as “switches”. The user code can set a Trigger bit in the CPLD and cause an event to occur. The Transfer Endterm sends one byte to the CPLD. The Block Endterm sends a block of bytes. By using one of the Active Host Endterms, the user can create a dynamic, bi-directional, and configurable data transfer design.

5.1 *Trigger EndTerm*

The Trigger EndTerm is a software component that provides a direct path from the users application to the commensurate Trigger EndTerm in the CPLD. The Trigger has eight bits and is intended to be used to provide a switch at the opposite EndTerm. They are fast acting and are not stored or buffered by memory. When the user code sets a Trigger, it is immediately passed through to the opposite EndTerm via the USB driver. When receiving Trigger, the user application is required to respond to a callback from the Active Host dll.

5.2 *Transfer(Byte) EndTerm*

The Transfer EndTerm is a software component that provides a direct path from the users application to the commensurate Transfer EndTerm in the CPLD. It is used to transfer a byte to and from the CPLD. Eight separate Transfer EndTerm modules can be instantiated in the CPLD. Each module is addressed by the user application. Sending a byte is easy, just use the function call with the address and byte value. The byte is immediately sent to the corresponding EndTerm in the CPLD. Receiving a byte is just as easy, a callback function is registered at initialization. When the CPLD transmits a

TERRANOLOGIC

USB CPLD Development System User Manual

byte using its EndTerm, the callback function is called in the user application. The user code must store this byte in order to use it. The incoming Transfers are stored in a circular buffer in memory. This allows the user code to fetch the transfers with out losing bytes.

5.3 *Block EndTerm*

The Block EndTerm is a software component that provides a direct path from the users application to the commensurate Block EndTerm in the CPLD. The Block EndTerm is used to transfer a complete block to the CPLD. Block size is limited to 1 to 256 bytes. Eight separate Block EndTerm modules can be instantiated in the CPLD. Each module is addressed by the user application. Sending a block is easy, just use the function call with the address, block length, byte array. The block is buffered into a circular buffer in memory then transmitted via the USB bus to the Block EndTerm in the CPLD.

Receiving a block is just as easy, a callback function is registered at initialization. When the CPLD transmits a block using its EndTerm, the callback function is called in the user application. The incoming Transfers are stored in a circular buffer in memory. This allows the user code to fetch the transfers with out losing bytes.

5.4 *Active Host DLL*

The Active_Host DLL is designed to transfer data from the CPLD when it becomes available. The data will be stored into local memory of the PC, and an event will be triggered to inform the user code that data is available from the addressed module of the CPLD. This method of automatically moving data from the user code Endterm in the CPLD makes the data transfer transparent.

The data seamlessly appears in Host PC memory from the Arduino. The user code will direct the data to a control such as a textbox on a Windows Form. The transparent receive transfer path is made possible by a Callback mechanism in the Active Host dll.

TERRANOLOGIC

USB CPLD Development System User Manual

The dll calls a registered callback function in the user code. The user code callback can be designed to generate any number of events to handle the received data.

The user application will access the CPLD by use of functions contained in the Active Host dll. The functions to access the CPLD are:

- EPT_AH_SendTrigger ()
- EPT_AH_SendByte ()
- EPT_AH_SendBlock ()
- EPT_AH_SendTransferControlByte()

5.4.1 Active Host Open Device

To use the library functions for data transfer and triggering, an Terranologic device must be opened. The first function called when the Windows Form loads up is the `<project_name>_Load()`. This function is called automatically upon the completion of the Windows Form, so there is no need to do anything to call it. Once this function is called, it in turn calls the `ListDevices()`. Use the function `List Devices()` to detect all EPT devices connected to the PC.

TERRANOLOGIC

USB CPLD Development System User Manual

```
private void EPT_Transfer_Test_Load(object sender, System.EventArgs e)
{
    //String buffer
    String PortText = "";

    //Index registers
    int Index = 0, EPTgroupNumber = 0;

    // Call the List Devices function
    List<string> names = ComPortNames("0403", "6010");

    // Get a list of serial port names.
    string[] ports;
    ports = SerialPort.GetPortNames();

    if (names.Count > 0)
    {
        foreach (String port in ports)
        {
            //Compare port name with the found VID/PID
            //combinations. Add them to Matching port list
            //and comboDevList
            if (names.Contains(port))
            {
                MatchingComPortList[Index] = port;

                if (Index == 0)
                {
                    PortText = "EPT JTAG Blaster " + EPTgroupNumber;
                    Index++;
                }
                else
                {
                    PortText = "EPT Serial Communications. " + EPTgroupNumber++;
                    Index++;
                }
                cmbDevList.Items.Add(PortText);
            }
        }
    }
    else
        MessageBox.Show("No EPT Devices found!");

    //SetButtonEnables_Close();
}
```

The ListDevices() function calls the

TERRANOLOGIC

USB CPLD Development System User Manual

```
ports = SerialPort.GetPortNames();
```

to determine the Serial devices attached to the PC. Next,

```
if (names.Contains(port))
```

is called inside a for loop to return the ASCII name of each Serial device attached to the PC. It will automatically populate the combo box, cmbDevList with all the EPT devices it finds.

```
cmbDevList.Items.Add(PortText);
```

The user will select the device from the drop down combo box. This can be seen when the Windows Form is opened and the cmbDevList combo box is populated with all the devices. The selected device will be stored as an index number in the variable device_index.

In order to select the device, the user will click on the “Open” button which calls the

```
OpenSerialPort1()
```

function. The device_index is passed into the function. If the function is successful, the device name is displayed in the label, labelDeviceCnt. Next, the Open button is grayed out and the Close button is made active.

TERRANOLOGIC

USB CPLD Development System User Manual

```
1 reference
public bool OpenSerialPort1()
{
    try
    {
        //Set the serial port parameters
        serialPort_AH.PortName = PortName;
        serialPort_AH.BaudRate = Convert.ToInt32(BaudRate);
        serialPort_AH.Parity = (Parity)Enum.Parse(typeof(Parity), vParity);
        serialPort_AH.DataBits = Convert.ToInt16(DataBits);
        serialPort_AH.StopBits = (StopBits)Enum.Parse(typeof(StopBits), StopBits);
        serialPort_AH.Handshake = (Handshake)Enum.Parse(typeof(Handshake), pHandshake);

        if (!serialPort_AH.IsOpen)
        {
            serialPort_AH.Open();
            btnOpenDevice.Enabled = false;
            btnCloseDevice.Enabled = true;
            //textBox1.ReadOnly = false;
            return true;
        }
    }
    catch (Exception ex)
    {
        MessageBox.Show(ex.Message);
    }
    return false;
}

..
```

5.4.2 Active Host Triggers

The user application can send a trigger to the CPLD by using the EPT_AH_SendTrigger() function. First, open the EPT device to be used with OpenSerialPort1 (). Call the function with the bit or bits to assert high on the trigger byte as the parameter. Then execute the function, the trigger bit or bits will momentarily assert high in the user code on the CPLD.

```
private void btnTrigger1_Click(object sender, EventArgs e)
{
    EPT_AH_SendTrigger((char) 1);
}
```

To detect a trigger from the CPLD, the user application must subscribe to the event created when the incoming trigger has arrived at the Read Callback function. The Read

TERRANOLOGIC

USB CPLD Development System User Manual

Callback must store the incoming trigger in a local variable. A switch statement is used to decode which event should be called to handle the incoming received data.

- TRIGGER_IN
- TRANSFER_IN
- BLOCK_IN

```
4 / *****
public void EPT_AH_Receive(byte[] receiveBytes)
{
    uint c, a, p, l, index;
    //Compare first byte to the incoming message code
    string s = String.Empty;
    foreach (byte b in receiveBytes)
    {
        s += String.Format("{0:x2}", (int)System.Convert.ToUInt32(b.ToString()));
        s += "\r\n";
    }
    //tbBlockRcv.AppendText(s);
    //this.Invoke(new MethodInvoker(delegate () { textBox1.AppendText(s); }));

    //Write the command into the EPTReceiveDevice
    c = (uint)receiveBytes[0];
    c = c & 0xf8;

    //Write the address into EPTReceiveDevice
    a = (uint)receiveBytes[0];
    a = a & 0x07;
    EPTReceiveDevice.Address = a;
    //Display Address to text box
    string r = String.Empty;
    r += String.Format("EPTReceiveDevice Address= {0:x2}", EPTReceiveDevice.Address);
    r += "\r\n";
    //this.Invoke(new MethodInvoker(delegate () { textBox1.AppendText(r); }));

    switch (c)
    {
        case 0xc8:
            //this.Invoke(new MethodInvoker(delegate () { textBox1.AppendText("Trigger Recieved\r\n"); }));
            EPTReceiveDevice.Command = TRIGGER_IN_COMMAND;
            break;
        case 0xd0:
            //this.Invoke(new MethodInvoker(delegate () { textBox1.AppendText("Transfer Byte Recieved\r\n"); }));
            EPTReceiveDevice.Command = TRANSFER_IN_COMMAND;
            break;
        case 0xe0:
            //this.Invoke(new MethodInvoker(delegate () { textBox1.AppendText("Block Recieved\r\n"); }));
            EPTReceiveDevice.Command = BLOCK_IN_COMMAND;
    }
}
```

TERRANOLOGIC

USB CPLD Development System User Manual

```
private void EPTParseReceive(object sender, System.EventArgs e)
{
    switch (EPTReceiveData.Command)
    {
        case TRIGGER_OUT_COMMAND:
            TriggerOutReceive();
            break;
        case TRANSFER_OUT_COMMAND:
            TransferOutReceive();
            break;
        case BLOCK_OUT_COMMAND:
            BLockOutReceive();
            break;
        default:
            break;
    }
}
```

The event handler function for the TRIGGER_IN's uses a switch statement to determine which trigger was asserted and what to do with it.

```
public void Receive_Trigger_In(object sender, EventArgs e)
{
    switch (ept_data.Payload)
    {
        case 0x01:
            lLabelSwitch1.Text = "Switch 1\n Pressed";
            break;
        case 0x02:
            lLabelSwitch2.Text = "Switch 2\n Pressed";
            break;
        case 0x04:
            lLabelSwitch1.Text = "";
            lLabelSwitch2.Text = "";
            break;
    }
}
```

The receive callback method is complex, however, Terranologic has created several projects which implement callbacks. Any part of these sample projects can copied and pasted into a user's project.

TERRANOLOGIC

USB CPLD Development System User Manual

5.4.3 Active Host Byte Transfers

The Active Host Byte Transfer EndTerm is designed to send/receive one byte to/from the EPT Device. To send a byte to the Device, the appropriate address must be selected for the Transfer module in the CPLD. Up to eight modules can be instantiated in the user code on the CPLD. Each module has its own address.

```
private void btnWriteByte_Click(object sender, EventArgs e)
{
    int ibyte, address_to_device;
    ibyte = Convert.ToInt32(tbNumBytes.Text);
    address_to_device = Convert.ToInt32(tbAddress.Text);
    EPT_AH_SendByte(address_to_device, (char)ibyte);
}
```

Use the function EPT_AH_SendByte() to send a byte the selected module. First, open the EPT device to be used with OpenSerialPort1(). Then add the address of the transfer module as the first parameter of the EPT_AH_SendByte() function. Enter the byte to be transferred in the second parameter. Then execute the function, the byte will appear in the ports of the Active Transfer module in the user code on the CPLD.

To transfer data from the CPLD Device, a polling technique is used. This polling technique is because the Bulk Transfer USB is a Host initiated bus. The Device will not transfer any bytes until the Host commands it to. If the Device has data to send to the Host in an asynchronous manner (meaning the Host did not command the Device to send data), the Host must periodically check the Device for data in it's transmit FIFO. If data exists, the Host will command the Device to send it's data. The received data is then stored into local memory and register bits are set that will indicate data has been received from a particular address.

To receive a byte transfer from the Active host dll, user code must subscribe to the event created when the incoming byte transfer has arrived at the Read Callback function. The Read Callback must store the incoming transfer payload and module address in a local memory block. A switch statement is used to decode which event should be called to handle the incoming received data. The event handler function will check for any bytes read for that address.

TERRANOLOGIC

USB CPLD Development System User Manual

```
private void EPTParseReceive(object sender, System.EventArgs e)
{
    switch (EPTReceiveData.Command)
    {
        case TRIGGER_OUT_COMMAND:
            TriggerOutReceive();
            break;
        case TRANSFER_OUT_COMMAND:
            TransferOutReceive();
            break;
        case BLOCK_OUT_COMMAND:
            BLockOutReceive();
            break;
        default:
            break;
    }
}
```

The EventHandler function EPTParseReceive() is called by the Read Callback function. The EPTParseReceive() function will examine the command of the incoming byte transfer and determine which receive function to call.

```
public void TransferOutReceive()
{
    string WriteRcvChar = "";
    WriteRcvChar = String.Format("{0}", (int)EPTReceiveData.Payload);
    tbDataBytes.AppendText(WriteRcvChar + ' ');
    tbAddress.Text = String.Format("{0:x2}", (uint)System.Convert.ToUInt32(EPTReceiveData.Address.ToString())
}
```

For our example project, the TransferOutReceive() function writes the Transfer byte received to a text block. The receive callback method is complex, however, Terranologic has created several projects which implement callbacks. Any part of these sample projects can be copied and pasted into a user's project.

5.4.4 Active Host Block Transfers

The Active Host Block Transfer is designed to transfer blocks of data between Host and CPLD and vice versa through the Block EndTerm. This allows buffers of data to be transferred with a minimal amount of code. The Active Host Block module (in the User Code) is addressable, so up to eight individual modules can be instantiated and separately addressed. The length of the block to be transferred must also be specified. The Block EndTerm is limited to 1 to 256 bytes.

TERRANOLOGIC

USB CPLD Development System User Manual

To send a block, first, open the EPT device to be used with `EPT_AH_OpenDeviceByIndex()`. Next, use the `EPT_AH_SendBlock()` function to send the block. Add the address of the transfer module as the first parameter. Next, place the pointer to the buffer in the second parameter of `EPT_AH_SendBlock()`. Add the length of the buffer as the third parameter. Then execute the function, the entire buffer will be transferred to the USB chip. The data is available at the port of the Active Block module in the user code on the CPLD.

```
public unsafe void BlockCompare(object data)
{
    int BlockAddress = (int)data;
    byte[] cBuf = new Byte[device[BlockAddress].Length];

    if ((device[BlockAddress].Repititions > 0) &
        !device[BlockAddress].TransferPending & !BlockTransferStop)
    {
        device[BlockAddress].TransferPending = true;
        Buffer.BlockCopy(block_8_in_payload, 0, cBuf, 0,
            device[BlockAddress].Length);
        fixed (byte* pBuf = cBuf)
        {
            EPT_AH_SendBlock(device[BlockAddress].Address,
                (void*)pBuf, (uint)device[BlockAddress].Length);
        }
        Thread.Sleep(1);
        EPT_AH_SendTransferControlByte((char)2, (char)2);
        Thread.Sleep(1);
        EPT_AH_SendTrigger((char)128);
        Thread.Sleep(1);
        EPT_AH_SendTransferControlByte((char)2, (char)0);

        if (BlockTransferInfinite)
            device[BlockAddress].Repititions = 1;
        else
            device[BlockAddress].Repititions--;
    }
}
```

To receive a block transfer from the CPLD Device, a polling technique is used by the Active Host dll. This is because the Bulk Transfer USB is a Host initiated bus. The Device will not transfer any bytes until the Host commands it to. If the Device has data

TERRANOLOGIC

USB CPLD Development System User Manual

to send to the Host in an asynchronous manner (meaning the Host did not command the Device to send data), the Host must periodically check the Device for data in its transmit FIFO. If data exists, the Host will command the Device to send its data. The received data is then stored into local memory and register bits are set that will indicate data has been received from a particular address. The receive callback function is then called from the Active Host dll. This function start a thread to do something with the block data.

To receive a byte transfer from the callback function, user code must subscribe to the event created when the incoming byte transfer has arrived at the Read Callback function. The Read Callback must store the incoming transfer payload and module address in a local memory block. A switch statement is used to decode which event should be called to handle the incoming received data. The event handler function will check for any bytes read for that address.

```
private void EPTParseReceive(object sender, System.EventArgs e)
{
    switch (EPTReceiveData.Command)
    {
        case TRIGGER_OUT_COMMAND:
            TriggerOutReceive();
            break;
        case TRANSFER_OUT_COMMAND:
            TransferOutReceive();
            break;
        case BLOCK_OUT_COMMAND:
            BLockOutReceive();
            break;
        default:
            break;
    }
}
```

The EventHandler function EPTParseReceive() is called by the Read Callback function. The EPTParseReceive() function will examine the command of the incoming byte transfer and determine which receive function to call.

TERRANOLOGIC

USB CPLD Development System User Manual

```
public void Receive_Block_In(object sender, EventArgs e)
{
    device[ept_data.Address].TransferPending = false;
    Thread.Sleep(5);
    if (device[ept_data.Address].ContinuosCountTest == false)
    {
        Thread t = new Thread(new ParameterizedThreadStart(BlockCompare));
        t.Start(ept_data.Address);
    }
    if (device[ept_data.Address].Repititions == 0)
    {
        Thread u = new Thread(new ParameterizedThreadStart(Display_Block_In));
        u.Start(BlockCount);
    }
    else if (BlockTransferInfinite | device[ept_data.Address].ContinuosCountTest)
    {
        if ((BlockCount % 100) == 0)
        {
            Thread u = new Thread(new ParameterizedThreadStart(Display_Block_In));
            u.Start(BlockCount);
        }
    }
}
```

For our example project, the Receive_Block_In() function writes the Transfer block received to a text block.

6 Assembling, Building, and Executing a .NET Project on the PC

The Active Host Application DLL is used to build a custom standalone executable on the PC that can perform Triggers and Transfer data to/from the UnoProLogic. A standalone project can be range from a simple program to display and send data from the user to/from the Arduino Uno. Or it can more complex to include receiving data, processing it, and start or end a process on the Arduino. This section will outline the procedures to take an example project and Assemble it, Build it, and Execute it.

This guide will focus on writing a Windows Forms application using the C# language for the Microsoft Visual Studio with .NET Framework. This is due to the idea that beginners can write effective Windows applications with the C# .NET Framework. They can focus on a subset of the language which is very similar to the C language. Anything that deviates from the subset of the C language, presented as in the Arduino

TERRANOLOGIC

USB CPLD Development System User Manual

implication (such as events and controls), will be explained as the explanation progresses. Any language can be used with the Active Host Application DLL.

6.1 Creating a Project

Once the application is installed, open it up. Click on File->New Project.

At the New Project window, select the Windows Forms Application. Then, at the Name: box, type in EPT_Transfer_Test

TERRANOLOGIC

USB CPLD Development System User Manual

The project creation is complete.

Save the project, go to File->Save as, browse to a folder to create EPT_Transfer_Test folder. The default location is c:\Users\<Users Name>\documents\visual studio 2010\Projects.

TERRANOLOGIC

USB CPLD Development System User Manual

6.1.1 Setting up the C# Express Environment x64 bit

The project environment must be set up correctly in order to produce an application that runs correctly on the target platform. If your system supports 64 bit operation, perform the following steps. Otherwise if your system is 32 bit skip to the Section, Assembling Files into the Project. Visual C# Express defaults to 32 bit operation. If you are unsure if your system supports, you can check it by going to Start->Control Panel->System and Security->System

Click on System.

TERRANOLOGIC

USB CPLD Development System User Manual

Check under System\System type:

First, we need tell C# Express to produce 64 bit code if we are running on a x64 platform. Go to Tools->Settings and select Expert Settings

TERRANOLOGIC

USB CPLD Development System User Manual

Go to Tools->Options, locate the “Show all settings” check box. Check the box.

In the window on the left, go to “Projects and Solutions”. Locate the “Show advanced build configurations” check box. Check the box.

TERRANOLOGIC

USB CPLD Development System User Manual

Go to Build->Configuration Manager.

In the Configuration Manager window, locate the “Active solution platform:” label, select “New” from the drop down box.

TERRANOLOGIC

USB CPLD Development System User Manual

In the New Solution Platform window, click on the drop down box under “Type or select the new platform:”. Select “x64”.

Click the Ok button. Verify that the “Active Solution Platform” and the “Platform” tab are both showing “x64”.

TERRANOLOGIC

USB CPLD Development System User Manual

Also, select “Release” under “Active solution configuration”. Click Close. Then, using the Solution Explorer, you can right click on the project, select Properties and click on the Build tab on the right of the properties window.

Verify that the “Platform:” label has “Active (x64)” selected from the drop down box.

TERRANOLOGIC

USB CPLD Development System User Manual

Click on the Save All button on the tool bar. The project environment is now setup and ready for the project files. Close the Project.

6.2 Assembling Files into the Project

Locate the UnoProLogic Development System CD installed on your PC. Browse to the EPT_Transfer_Test folder where the Project files reside, copy the*.cs files, and install them in the top level folder of your EPT_Transfer_Test project.

TERRANOLOGIC

USB CPLD Development System User Manual

6.2.1 Changing Project Name

NOTE

If you named your project something other than EPT_Transfer_Test, you will have to make changes to the *.cs files above. This is because Visual C# Express links the project files and program files together. These changes can be made by modifying the following:

1. Change namespace of Form1.cs to new project name.
2. Change class of Form1.cs to new project name.
3. Change constructor of Form1.cs to new project name.

```
EPT_FT2232_Interface.EPT_FT2232_Interface
using System;
using System.Drawing;
using System.Collections;
using System.Windows.Forms;
using System.Data;
using System.Threading;
using System.Runtime.InteropServices;
using System.Diagnostics;

1 namespace EPT_FT2232_Interface
{
2     public partial class EPT_FT2232_Interface : System.Windows.Forms.Form
3     {
        public EPT_FT2232_Interface()
        {
            InitializeComponent();

            for (int i = 0; i < device.Length; ++i)
            {
                device[i] = new Transfer();
            }
        }
    }
}
```

4. Change EPT_Transfer_Test_Load of Form1.cs to new <project name>_Load

```
// Main object loader
private void EPT_FT2232_Interface_Load(object sender, System.EventArgs e)
{
    // Call the List Devices function
    ListDevices();
}
```

5. Change namespace of Form1.Designer.cs to new project name.
6. Change class of Form1.Designer.cs to new project name.

TERRANOLOGIC

USB CPLD Development System User Manual

```

EPT_FT2232_Interface.EPT_FT2232_Interface
namespace EPT_FT2232_Interface
{
    partial class EPT_FT2232_Interface
    {
        /// <summary>
        /// Required designer variable.
        /// </summary>
        private System.ComponentModel.IContainer components = null;

        /// <summary>
        /// Clean up any resources being used.
        /// </summary>
        /// <param name="disposing">true if managed resources should be disposed; otherwise, false.</param>
        protected override void Dispose(bool disposing)
        {
            if (disposing && (components != null))
            {
                components.Dispose();
            }
            base.Dispose(disposing);
        }
    }
}

```

7. Change the this.Name and this.Text in Form1Designer.cs to new project name.
8. Change this.Load in Form1Designer.cs to include new project name.

```

this.Controls.Add(this.btnTrigger3);
this.Controls.Add(this.btnTrigger2);
this.Controls.Add(this.btnTrigger1);
this.Controls.Add(this.btnCloseDevice);
this.Controls.Add(this.btnOpenDevice);
this.Controls.Add(this.cmbDevList);
this.Controls.Add(this.LEDBox);
this.Controls.Add(this.gbTriggerOut);
this.Controls.Add(this.gbTransferControl);
this.Controls.Add(this.groupBox1);
this.Name = "EPT_FT2232_Interface";
this.Text = "EPT_FT2232_Interface";
this.Load += new System.EventHandler(this.EPT_FT2232_Interface_Load);
this.LEDBox.ResumeLayout(false);
this.LEDBox.PerformLayout();
this.gbTriggerOut.ResumeLayout(false);
this.gbTransferControl.ResumeLayout(false);
this.gbTransferControl.PerformLayout();
this.groupBox1.ResumeLayout(false);
this.groupBox1.PerformLayout();
this.ResumeLayout(false);
this.PerformLayout();

```

9. Change namespace in Program.cs to new project name
10. Change Application.Run() in Program .cs to new projectname.

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Windows.Forms;

namespace EPT_FT2232_Interface
{
    static class Program
    {
        /// <summary>
        /// The main entry point for the application.
        /// </summary>
        [STAThread]
        static void Main()
        {
            Application.EnableVisualStyles();
            Application.SetCompatibleTextRenderingDefault(false);
            Application.Run(new EPT_FT2232_Interface());
        }
    }
}

```

TERRANOLOGIC

USB CPLD Development System User Manual

6.2.2 Add Files to Project

Open the EPT_Transfer_Test project. Right click on the project in the Solutions Explorer. Select Add->Existing Item.

Browse to the EPT_Transfer_Test project folder and select the active_transfer_xx.cs file. Click Add.

TERRANOLOGIC

USB CPLD Development System User Manual

In the C# Express Solution Explorer, you should be able to browse the files by clicking on them. There should be no errors noted in the Error List box.

TERRANOLOGIC

USB CPLD Development System User Manual

6.2.3 Adding Controls to the Project

Although, the C# language is very similar to C Code, there are a few major differences. The first is C# .NET environment is event based. A second is C# utilizes classes. This guide will keep the details of these items hidden to keep things simple. However, a brief introduction to events and classes will allow the beginner to create effective programs.

Event based programming means the software responds to events created by the user, a timer event, external events such as serial communication into PC, internal events such as the OS, or other events. The events we are concerned with for our example program are user events and the timer event. The user events occur when the user clicks on a button on the Windows Form or selects a radio button. We will add a button to our example program to show how the button adds an event to the Windows Form and a function that gets executed when the event occurs.

The easiest way to add a button to a form is to double click the Form1.cs in the Solution Explorer. Click on the  button to launch the Toolbox.

TERRANOLOGIC

USB CPLD Development System User Manual

Locate the button on the Toolbox, grab and drag the button onto the Form1.cs [Design] and drop it near the top.

TERRANOLOGIC

USB CPLD Development System User Manual

Go to the Properties box and locate the (Name) cell. Change the name to “btnOpenDevice”. Locate the Text cell, and change the name to Open.

TERRANOLOGIC

USB CPLD Development System User Manual

Double click on the Open button. The C# Explorer will automatically switch to the Form1.cs code view. The callback function will be inserted with the name of the button along with “_click” appended to it. The parameter list includes (object sender, System.EventArgs e). These two additions are required for the callback function to initiate when the “click” event occurs.

```
Private void btnOpenDevice_click(object sender, System.EventArgs e)
```

There is one more addition to the project files. Double click on the Form1.Designer.cs file in the Solution Explorer. Locate the following section of code.

TERRANOLOGIC

USB CPLD Development System User Manual

```
//  
// btnOpenDevice  
//  
this.btnOpenDevice.Location = new System.Drawing.Point(240, 13);  
this.btnOpenDevice.Name = "btnOpenDevice";  
this.btnOpenDevice.Size = new System.Drawing.Size(50, 23);  
this.btnOpenDevice.TabIndex = 2;  
this.btnOpenDevice.Text = "Open";  
this.btnOpenDevice.UseVisualStyleBackColor = true;  
this.btnOpenDevice.Click += new System.EventHandler(this.btnOpenDevice_Click);
```

This code sets up the button, size, placement, and text. It also declares the “System.EventHandler()”. This statement sets the click method (which is a member of the button class) of the btnOpenDevice button to call the EventHandler – btnOpenDevice_Click. This is where the magic of the button click event happens.

```
private void btnOpenDevice_Click(object sender, EventArgs e)  
{  
    //Open the Device  
    OpenDevice();  
}  
  
private void btnCloseDevice_Click(object sender, EventArgs e)  
{  
    if (EPT_AH_CloseDeviceByIndex(device_index) != 0)  
    {  
        btnBlkCompare8.Enabled = false;  
        btnBlkCompare16.Enabled = false;  
        btnTrigger1.Enabled = false;  
        btnTrigger2.Enabled = false;  
        btnTrigger3.Enabled = false;  
        btnTrigger4.Enabled = false;  
        btnLEDReset.Enabled = false;  
    }  
    btnOpenDevice.Enabled = true;  
    btnCloseDevice.Enabled = false;  
}
```

When btnOpenDevice_Click is called, it calls the function “OpenDevice()”. This function is defined in the dll and will connect to the device selected in the combo box. This is a quick view of how to create, add files, and add controls to a C# project. The user is encouraged to spend some time reviewing the online tutorial at

TERRANOLOGIC

USB CPLD Development System User Manual

<http://www.homeandlearn.co.uk/csharp/csharp.html> to become intimately familiar with Visual C# .NET programming. In the meantime, follow the examples from the Terranologic to perform some simple reads and writes to the EPT USB-CPLD Development System.

6.2.4 Adding the DLL's to the Project

Locate the UnoProLogic Development System CD installed on your PC. Browse to the Projects_ActiveHost folder. Open the Bin folder, copy the following files:

- ActiveHostXX.dll
- ftd2xxXX.dll

and install them in the bin\x64\x64 folder of your EPT Transfer Test project.

Save the project.

6.2.5 Building the Project

Building the EPT_Transfer_Test project will compile the code in the project and produce an executable file. To build the project, go to Debug->Build Solution.

TERRANOLOGIC

USB CPLD Development System User Manual

The C# Express compiler will start the building process. If there are no errors with code syntax, function usage, or linking, then the environment responds with “Build Succeeded”.

6.2.6 Testing the Project

Once the project has been successfully built, it produces an *.exe file. The file will be saved in the Release or Debug folders.

TERRANOLOGIC

USB CPLD Development System User Manual

The EPT_Transfer_Test.exe file can now be tested using the UnoProLogic board. To test the file, connect the UnoProLogic to the Windows PC using Type A to Type USB-C cable. Make sure the driver for the board loads. If the USB driver fails to load, the Windows OS will indicate that no driver was loaded for the device. Go to the folder where the EPT_Transfer_Test.exe file resides, and double click on the file. The application should load with a Windows form.

TERRANOLOGIC

USB CPLD Development System User Manual

With the application loaded, select the USB-CPLD board from the dropdown combo box and click on the “Open” button.

TERRANOLOGIC

USB CPLD Development System User Manual

Click on one of the LED buttons in the middle of the window. The corresponding LED on the UnoProLogic-U2 board should light up.

To exercise the Single Byte Transfer EndTerm, click the “Byte” button in the Transfer Controls group. Type in several numbers separated by a space and less 256 into the Multiple Byte textbox. Then hit the Multi Byte button. The numbers appear in the Receive Byte textbox.

TERRANOLOGIC

USB CPLD Development System User Manual

To exercise the Block Transfer EndTerm, click the “Start” button in the GPIO Controls group. The UnoProLogic will sample the state of each Input pin from around the board and display the result of each pin on the window.

TERRANOLOGIC

USB CPLD Development System User Manual

Press the PCB switches on the UnoProLogic to view the Switch Controls in action.

7 Using the Analog to Digital Converter

The EPT 5M57-AP-U2 has an onboard Four Channel, 10 Bit, 300 KSamples/second Analog to Digital Converter. It has a serial SPI communications that allow the host to send setup commands and retrieve the sampled data.

TERRANOLOGIC

USB CPLD Development System User Manual

PIN	NAME	FUNCTION
1–4	AIN0–AIN3	Analog Inputs
5, 6, 7	N.C.	No Connection
8	CONVST	Active – low Conversion Start Input
9	REF	Reference Input
10	GND	Ground
11	VDD	Power Input
12	CS	Active Low Chip Select Input. When CS is Low the interface is enabled. When CS is high MOSI is high impedance
13	SCLK	Serial Clock input. Clocks data in and out of the serial interface.
14	MISO	Serial Data input. MISO data is latched into the interface on the rising edge of SCLK
15	MOSI	Serial Data Output. Data is clocked out on the falling edge of SCLK. High impedance when CS is connected to VDD.
16	EOC	End of Conversion Output. Data is valide after EOC

7.1 Register Descriptions

The MAX11618 communicate between the internal registers and the external circuitry through the SPI-/QSPI-compatible serial interface. Table 1 details the registers and the bit names. Tables 2–5 show the various functions within the conversion register, setup register, averaging register, and reset register.

Table 1. Input Data Byte (MSB First)

REGISTER NAME	BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
Conversion	1	CHSEL3	CHSEL2	CHSEL1	CHSEL0	SCAN1	SCAN0	X
Setup	0	1	CKSEL1	CKSEL0	REFSEL1	REFSEL0	X	X
Averaging	0	0	1	AVGON	NAV1	NAV0	NSCAN1	NSCAN0
Reset	0	0	0	1	RESET	X	X	X

X = Don't care.

7.2 Conversion Register

Select active analog input channels per scan and scan modes by writing to the conversion register. Table 2 details channel selection and the four scan modes. Request a scan by writing to the conversion register when in clock mode 10 or 11, or by applying a low pulse to the CNVST pin when in clock mode 00 or 01.

A conversion is not performed if it is requested on a channel that has been configured as CNVST. Select scan mode 00 or 01 to return one result per single- ended channel within the requested range. Select scan mode 10 to scan a single input channel numerous times, depending on NSCAN1 and NSCAN0 in the averaging register (Table 4). Select scan mode 11 to return only one result from a single channel.

TERRANOLOGIC

USB CPLD Development System User Manual

Table 2. Conversion Register*

BIT NAME	BIT	FUNCTION
—	7 (MSB)	Set to 1 to select conversion register.
CHSEL3	6	Analog input channel select.
CHSEL2	5	Analog input channel select.
CHSEL1	4	Analog input channel select.
CHSEL0	3	Analog input channel select.
SCAN1	2	Scan mode select.
SCAN0	1	Scan mode select.
—	0 (LSB)	Don't care.

CHSEL1	CHSEL0	SELECTED CHANNEL (N)
0	0	AIN0
0	1	AIN1
1	0	AIN2
1	1	AIN3

SCAN1	SCAN0	SCAN MODE (CHANNEL N IS SELECTED BY BITS CHSEL3–CHSEL0)
0	0	Scans channels 0 through N.
0	1	Scans channels N through the highest numbered channel.
1	0	Scans channel N repeatedly. The averaging register sets the number of results.
1	1	No scan. Converts channel N once only.

7.3 Setup Register

Write a byte to the setup register to configure the clock, reference, and power-down modes. Table 3 details the bits in the setup register. Bits 5 and 4 (CKSEL1 and CKSEL0) control the clock mode, acquisition and sampling, and the conversion start. Bits 3 and 2 (REFSEL1 and REFSEL0) control internal or external reference use.

TERRANOLOGIC

USB CPLD Development System User Manual

Table 3. Setup Register*

BIT NAME	BIT	FUNCTION
—	7 (MSB)	Set to zero to select setup register.
—	6	Set to 1 to select setup register.
CKSEL1	5	Clock mode and $\overline{\text{CNVST}}$ configuration. Resets to 1 at power-up.
CKSEL0	4	Clock mode and $\overline{\text{CNVST}}$ configuration.
REFSEL1	3	Reference mode configuration.
REFSEL0	2	Reference mode configuration.
—	1	Don't care.
—	0 (LSB)	Don't care.

*See below for bit details.

CKSEL1	CKSEL0	CONVERSION CLOCK	ACQUISITION/SAMPLING	$\overline{\text{CNVST}}$ CONFIGURATION
0	0	Internal	Internally timed	$\overline{\text{CNVST}}$
0	1	Internal	Externally timed through $\overline{\text{CNVST}}$	$\overline{\text{CNVST}}$
1	0	Internal	Internally timed	AIN15/AIN11/AIN7**
1	1	External (4.8MHz max)	Externally timed through SCLK	AIN15/AIN11/AIN7**

**For the MAX11618/MAX11619, $\overline{\text{CNVST}}$ has its own dedicated pin.

REFSEL1	REFSEL0	VOLTAGE REFERENCE	AutoShutdown
0	0	Internal	Reference off after scan; need wake-up delay.
0	1	External single ended	Reference off; no wake-up delay.
1	0	Internal	Reference always on; no wake-up delay.
1	1	Reserved	Reserved. Do not use.

7.4 Averaging Register

Write to the averaging register to configure the ADC to average up to 32 samples for each requested result, and to independently control the number of results requested for single-channel scans. Table 2 details the four scan modes available in the conversion register. All four scan modes allow averaging as long as the AVGON bit, bit 4 in the averaging register, is set to 1. Select scan mode 10 to scan the same channel multiple times. Clock mode 11 disables averaging.

TERRANOLOGIC

USB CPLD Development System User Manual

Table 4. Averaging Register*

BIT NAME	BIT	FUNCTION
—	7 (MSB)	Set to 0 to select averaging register.
—	6	Set to 0 to select averaging register.
—	5	Set to 1 to select averaging register.
AVGON	4	Set to 1 to turn averaging on. Set to zero to turn averaging off.
NAV1	3	Configures the number of conversions for single-channel scans.
NAV0	2	Configures the number of conversions for single-channel scans.
NSCAN1	1	Single-channel scan count. (Scan mode 10 only.)
NSCAN0	0 (LSB)	Single-channel scan count. (Scan mode 10 only.)

*See below for bit details.

AVGON	NAV1	NAV0	FUNCTION
0	X	X	Performs 1 conversion for each requested result.
1	0	0	Performs 4 conversions and returns the average for each requested result.
1	0	1	Performs 8 conversions and returns the average for each requested result.
1	1	0	Performs 16 conversions and returns the average for each requested result.
1	1	1	Performs 32 conversions and returns the average for each requested result.

X = Don't care.

NSCAN1	NSCAN0	FUNCTION (APPLIES ONLY IF SCAN MODE 10 IS SELECTED)
0	0	Scans channel N and returns 4 results.
0	1	Scans channel N and returns 8 results.
1	0	Scans channel N and returns 12 results.
1	1	Scans channel N and returns 16 results.

7.5 Reset Register

Write to the reset register (as shown in Table 5) to clear the FIFO or to reset all registers to their default states. Set the RESET bit to 1 to reset the FIFO. Set the reset bit to zero to return the MAX11618 to the default power-up state.

TERRANOLOGIC

USB CPLD Development System User Manual

Table 5. Reset Register

BIT NAME	BIT	FUNCTION
—	7 (MSB)	Set to 0 to select reset register.
—	6	Set to 0 to select reset register.
—	5	Set to 0 to select reset register.
—	4	Set to 1 to select reset register.
$\overline{\text{RESET}}$	3	Set to zero to reset all registers. Set to 1 to clear the FIFO only.
X	2	Don't care.
X	1	Don't care.
X	0 (LSB)	Don't care.

8 The UnoProLyzer Application

The source DVD for the UnoProLogic2 comes with the UnoProLyzer application project. This project allows the user to display 1 to 4 channels of analog input in a graphing application. The project utilizes the PC to perform all data storage and graphing. The PC sends commands to and receives the data from the UnoProLogic2 and stores each channel data in its own separate buffer in memory. The UnoProLyzer collects all samples from each channel by streaming across up to four dedicated communication “pipes”.

The UnoProLogic2 commands the ADC to start a conversion on the channels selected by the user. It then waits for the ADC to complete the conversion on all channels. It transfers the data for each channel across its own dedicated communication pipe. Then starts the process over again. The UnoProLyzer application will accept each data word and decode the pipe number it came across. It stores each word into a separate buffer for each channel. The UnoProLyzer then performs post processing on each data word. It performs trigger detection, smoothing, sorting, scaling and searching. It then displays the data set in 500 data point segments.

TERRANOLOGIC

USB CPLD Development System User Manual

8.1 Accessing the UnoProLyzer Application

Locate the EPT_Data_Acquisition folder in the Drivers folder of the UnoProLogic Development System DVD using Windows Explorer.

Go to the Release folder and locate the EPT_Data_Acquisition.exe file.

TERRANOLOGIC

USB CPLD Development System User Manual

Make sure the UnoProLogic is installed and the USB driver has been loaded.

Double click on the EPT_Data_Acquisition.exe file and the UnoProLyzer Application will open.

TERRANOLOGIC

USB CPLD Development System User Manual

Go to the upper right of the window and click on the drop down box.

Select the “EPT USB<-> Serial&JTAG Cable B. Then click on the Open button

TERRANOLOGIC

USB CPLD Development System User Manual

Next, select the number of channels to display. The channels have to be selected in sequential order, you cannot pick out single channel (except for channel 1). So for two channels, click on the “1 to 2” button. This will display the data from both channel 1 and 2.

TERRANOLOGIC

USB CPLD Development System User Manual

Next, click on the Start button.

TERRANOLOGIC

USB CPLD Development System User Manual

The data from the two channels will appear at the same latitude on the graph.

TERRANOLOGIC

USB CPLD Development System User Manual

Next, locate the Channel Select drop down box and click on channel 1.

TERRANOLOGIC

USB CPLD Development System User Manual

Locate the Vertical Position slider and pull it down. The channel 1 data will change position in the graph depending on where you move the slider. The voltage magnitude data also adjusts to indicate the magnitude of the data relative to the position of channel 1 data.

TERRANOLOGIC

USB CPLD Development System User Manual

The selected channel will show up as a large icon. Its position indicates the zero position of the data. The magnitude information along the y-axis is only for the selected channel.

Then connect a signal to the channel 1 input on the UnoProLogic2.

TERRANOLOGIC

USB CPLD Development System User Manual

If you don't have a 0-5 Volt signal to connect to the UnoProLogic2, you can use your finger and touch it to the bottom of the Analog Input Connector. The ambient electricity from your body has just enough current to give the Analog inputs a deflection from zero.

Now the UnoProLogic2 and UnoProLyzer are ready to measure an 0-5VDC signals.

9 UnoProLogic Development Process

There is no standard for developing embedded electronics. The best method is the one that works for the user. These methods can range from a top down approach where the design is written down first and all code is written, then compile, execute and test. Or a bottom up approach can be pursued where a small piece of the project is assembled and verified (i.e. I2C communication to a sensor). Then the next piece is assembled and verified (i.e. collect sensor data in a storage buffer) and connected to the first. And so

TERRANOLOGIC

USB CPLD Development System User Manual

on, until the whole design is complete. Or, you could use any combination of these two extremes.

9.1 *Designing a Simple Data Collection Sampler*

The Data Collection Sampler is a very simple introductory project that will guide the user in the creation of an overall design using the Arduino Programming Language, Verilog HDL, and C# Language. These elements will run on the Arduino Platform, UnoProLogic-U2 CPLD, and a Windows 7 PC respectively.

The first order of business is to layout the design. Start with the Arduino, and create a simple bit output using a random number generator. Next, use the EPT Active Transfer Library to create a byte transfer module to read the byte from the Arduino and send it to the Host PC. Finally, use EPT Active Host to accept the byte transfer from EPT Active Transfer, and display in a textbox. This is just the hierarchical system level design. In the following sections, we will fill in the above blocks.

9.1.1 The Arduino Microcontroller Board

Using the features and capabilities of the Arduino development system, the user will develop the source code using the “Wiring” programming language and download the resulting binary code from the Processing development environment to the Flash memory of the microcontroller.

TERRANOLOGIC

USB CPLD Development System User Manual

9.1.2 Create Data Generator

To keep the design simple, no external data source will be used. We will create a data source using the Arduino, then transmit this data to the UnoProLogic board. To create the data source, we will use the `random()` function. This function generates pseudo random numbers from a seed value. We will give the `randomSeed()` function a fairly random input using the value from the `analogRead()`. This will give different values every time the `random()` function is called. We will limit the random number output from the function to 8 bits. The `random()` function will be called once per iteration of the `loop()` function.

The `randomSeed()` function must be called during the `setup()` function. It takes as input parameter the output of the Analog Pin 1. The output of this Pin 1 will have a small amount of random noise on it. Because of this noise, the `randomSeed()` function will produce a different seed every time the sketch is initialized.

```
void setup()
{
    randomSeed(analogRead(1));
}
```

9.1.3 Select I/O's for Fast Throughput on Arduino

An 8 bit port is used to connect the 8 bit byte from the random function output to the input of the UnoProLogic. There is also a one bit control line which will be used to inform the CPLD that a byte is ready to be written to the USB.

TERRANOLOGIC

USB CPLD Development System User Manual

Each port is controlled by three registers, which are also defined variables in the Arduino language. The DDR register, determines whether the pin is an INPUT or OUTPUT. The PORT register controls whether the pin is HIGH or LOW, and the PIN register reads the state of INPUT pins set to input with `pinMode()`. The maps of the ATmega328 chips show the ports.

DDR and PORT registers may be both written to, and read. PIN registers correspond to the state of inputs and may only be read.

PORTD maps to Arduino digital pins 0 to 7

DDRD - The Port D Data Direction Register - read/write

PORTD - The Port D Data Register - read/write

PIND - The Port D Input Pins Register - read only

The ports and pins for the Data Collection Sampler project must be initialized in the `setup()` function. The setup function will only run once, after each powerup or reset of the Arduino board.

```
int ledPin = 13;

void setup()
{
  DDRD = B11111111; //Set Port D as outputs
  PORTD &= B11111111; //Turn on Port D pins

  pinMode(A0, OUTPUT);
}
```

After the `setup()` function executes, the PORTD is ready to be assigned the results of our `random()` function. And the A0 pin will be used to latch the value on PORTD pins into the CPLD.

TERRANOLOGIC

USB CPLD Development System User Manual

9.1.4 Coding the Arduino Data Sampler

Now that we have the data generator and the ports defined, we can add some delays in the loop() function and make a simulated data collector. Because Start and Stop buttons will be added to the C# Windows Form, the Data Collector code will need to monitor a single pin output from the UnoProLogic. This output pin (from the UnoProLogic) becomes an input to the Arduino and is used in conditional switch.

```
void loop ()
{
    //Sample the Start/Stop switch
    //from the EPT-570-AP
    startStopBit = digitalRead(inPin8);

    delay(500); //Delay 500 ms

    if(startStopBit)
    {
```

This code will sample the Start/Stop switch which is an output from the UnoProLogic on J10 PIN 1. On the Arduino, this is PIN 8 of the Digital pins. Each iteration of the loop() function, the startStopBit variable stores the state of DigitalPin8. Then, a delay of 500 milliseconds is added. The delay() function pauses the program for the amount of time (in milliseconds) specified as parameter. Next, the startStopBit is checked with a conditional switch. If the bit is set, the conditional branch is entered and the random number is sent to the UnoProLogic. If the bit is not set, the end of the loop() function is reached and it branches to the top of the loop().

We will also add an LED Pin that will blink so that we can have a visual indication that the project is working.

We want to add a delay so that the data from the generated displays on the Windows PC long enough for our eyes to verify that the data is updating correctly. This delay should be one second in total. So, the data will change then stay stable in the textbox for one second before changing again.

For the LED to blink correctly, it should turn on, delay for half a second then turn off and delay for half a second. If we don't use half second intervals for the LED blink, the LED will appear to not change at all. It will look like it stays on all the time or off all the time.

TERRANOLOGIC

USB CPLD Development System User Manual

So, the code looks like this:

TERRANOLOGIC

USB CPLD Development System User Manual

```
/*
  Copyright Earth People Technology Inc. 2012

  Data Collector Random Seed

  Platform: EPT-570-AP-U2
*/

int startStopBit = 0;
int count = 0;
int ledPin = 13;
int inPin8 = 8;

void setup()
{
  DDRD = B11111111; //Set Port D as outputs
  PORTD &= B11111111; //Turn on Port D pins

  pinMode(A0, OUTPUT);
  pinMode(ledPin, OUTPUT);
  pinMode(inPin8, OUTPUT);

  randomSeed(analogRead(1));
}

void loop ()
{
  //Sample the Start/Stop switch
  //from the EPT-570-AP
  startStopBit = digitalRead(inPin8);

  delay(500); //Delay 500 ms

  if(startStopBit)
  {
    // Write a random number from 0 to 299
    //to the input of the EPT-570-AP
    PORTD = random(255);
    //Set the Write Enable Pin High
    digitalWrite(A0, HIGH);
  }
}
```

TERRANOLOGIC

USB CPLD Development System User Manual

```
//Set the LED Pin High
digitalWrite(ledPin, HIGH);

delay(500); //Delay 500 ms

//Set the LED Pin Low
digitalWrite(ledPin, LOW);
//Set the Write Enable Pin Low
digitalWrite(A0, LOW);
}
}
```

Notice that PORTD equals the return of random(255). The parameter passed to the random() function is the maximum decimal value of the return value. In our case we want the maximum value to be an 8 bit value, $B11111111 = 0xff = 255(\text{decimal})$. Also, note that the A0 write enable signal for the CPLD has back to back instructions turning it on then off immediately. Because the ATmega328 chip takes approximately 160 clock cycles to execute the digitalWrite() function and affect the Pin at A0, this produces a write enable pulse of 10 microseconds.

The RANDOM VALUE will be stable before the A0(WRITE ENABLE) asserts thus guaranteeing a successful transfer of data from Arduino to CPLD.

9.1.5 Building Arduino Project

Building the Arduino project is the process of converting (compiling) the code you just wrote into machine level code that the processor can understand. The Arduino IDE is the software tool that does the compiling. The machine level code is a set of basic instructions that the processor uses to perform the functions the user code. Browse to

TERRANOLOGIC

USB CPLD Development System User Manual

the \Projects_Arduino\Arduino_Data_Collector_Code\ folder of the UnoProLogic Development System CD. Copy Arduino_Data_Collector_Code_U2.ino .

To compile your code,

- Open up the Arduino IDE

- Load your code into the Sketch.

TERRANOLOGIC

USB CPLD Development System User Manual

- Click the Verify button

TERRANOLOGIC

USB CPLD Development System User Manual

- The sketch will compile

- If there are no errors, the compiling will complete successfully

Now we are done with compiling and ready to program the Arduino

9.1.6 Programming the Arduino

Programming the Arduino is the process of downloading the user's compiled code into the Flash memory of the Atmel ATmega328 chip. Once the code is downloaded, the Arduino IDE resets the chip and the processor starts executing out of Flash memory.

To program the Arduino

- Connect the USB cable from PC to Arduino

- Load the Arduino USB driver according to the manual
- Plug in your board and wait for Windows to begin its driver installation process. After a few moments, the process will fail, despite its best efforts

TERRANOLOGIC

USB CPLD Development System User Manual

- Click on the Start Menu, and open up the Control Panel.
- While in the Control Panel, navigate to System and Security. Next, click on System. Once the System window is up, open the Device Manager.
- Look under Ports (COM & LPT). You should see an open port named "Arduino UNO (COMxx)"
- Right click on the "Arduino UNO (COMxx)" port and choose the "Update Driver Software" option.
- Next, choose the "Browse my computer for Driver software" option.
- Finally, navigate to and select the Uno's driver file, named "**ArduinoUNO.inf**", located in the "Drivers" folder of the Arduino Software download (not the "FTDI USB Drivers" sub-directory).
- Windows will finish up the driver installation from there.

- Once the driver is loaded, we can set the COM Port. Click on Tools and select Serial Port, then click the available port.

TERRANOLOGIC

USB CPLD Development System User Manual

- To load the code, click on the Upload button.

TERRANOLOGIC

USB CPLD Development System User Manual

When the code has completed loading, the Arduino IDE will automatically command the processor to start executing the code. The L LED will blink at one second intervals.

9.1.7 CPLD Active Transfer EndTerm Coding and Initiation

The UnoProLogic will accept the data collected by the Arduino and transfer it to the PC. It is designed to plug directly into the Arduino Uno and there is no need for external wires to be added. The Active Transfer EndTerms are used to connect the Active

TERRANOLOGIC

USB CPLD Development System User Manual

Transfer Library to the user code. This makes it easy to transfer data to and from the PC via the USB. The user needs to create a state machine to control the transfer between the incoming data and the Active Transfer EndTerms. We will now go through exercise of creating the CPLD code for the Data Collector Sampler.

9.1.8 CPLD: Define the User Design.

In this step we will define the user's code and include EndTerms and the EPT Active Transfer Library. The Active Transfer Library contains a set of files with a ".vqm" name extension which select particular operations to perform (e.g., byte transfer, block transfer, trigger).. The active_transfer_library.vqm file must be included in the top level file of the project. The EndTerms will connect to the active_transfer_library and provide a path to connect user code to the library. All of these files are available on the Terranologic Project CD.

We will build our CPLD project using Quartus Prime software from Intel. The primary file defining the user's CPLD project is named "EPT_570_AP_U2_Top.v". It defines

TERRANOLOGIC

USB CPLD Development System User Manual

the user code and connects the `active_transfer_library` and `active_transfer` logic functions. In order to route the pins of the Arduino to the CPLD, the Pin Planner tool is used. This tool allows the user to match internal net names to the pins of the CPLD.

Our project needs to accept an 8 bit value on the J8 connector and a write enable on Pin 1 of J9. For this, we can use the `active_transfer.vqm` module as the interface to the `active_transfer_library`. It accepts a single byte and latches it with a single enable net. Because the `active_transfer_library` runs at 66 MHz we will need to write some code ensure that the slower A0 (write enable) signal from the Arduino can latch the data into the `active_transfer` module.

CPLD: Coding up the DesignThe first thing to do is to create a top level file for the project. The top level file will include the input and outputs for the CPLD. These are declared according to the Verilog syntax rules. We won't go through all the rules of Verilog here, but feel free to explore the language more thoroughly at

www.asic-world.com/verilog/

We need to add the inputs and outputs for `active_transfer_library`, user code, leds, and switches. Each port is described as input, output or inout. It is followed by the net type wire or reg. If it is a vector, the array description must be added.

TERRANOLOGIC

USB CPLD Development System User Manual

```
module EPT_570_AP_U2_Top (

    input wire [1:0]      aa,
    input wire [1:0]      bc_in,
    output wire [2:0]      bc_out,
    inout wire [7:0]       bd_inout,

    input wire [1:0]       TRIGGER_IN_HIGH, //XIOH -- J10
    input wire [5:0]       TRIGGER_IN_LOW,  //AD  -- J9
    output reg [7:0]       LB_LOWER,         //XIOH -- J10
    input wire [7:0]       LB_UPPER,         //XIOH -- J8

    //Transceiver Control Signals
    output reg             TR_DIR_1,
    output reg             TR_OE_1,

    output wire            TR_DIR_2,
    output wire            TR_OE_2,

    output wire            TR_DIR_3,
    output wire            TR_OE_3,

    input wire             SW_USER_1,
    input wire             SW_USER_2,

    output reg [2:0]       LED,
    output wire            LED3
);
```

TERRANOLOGIC

USB CPLD Development System User Manual

Next, the parameter's are defined. These are used as constants in the user code.

```
//-----  
// Parameters  
//-----  
  
//Header Bytes for the Transfer Loopback detection  
parameter          TRANSFER_CONTROL_BYTE1 = 8'h5A;  
parameter          TRANSFER_CONTROL_BYTE2 = 8'hC3;  
parameter          TRANSFER_CONTROL_BYTE3 = 8'h7E;  
  
//State Machine Transfer Loopback detection  
parameter          TRANSFER_CONTROL_IDLE = 0,  
                   TRANSFER_CONTROL_HDR1 = 1,  
                   TRANSFER_CONTROL_HDR2 = 2,  
                   TRANSFER_DECODE_BYTE = 3,  
                   TRANSFER_CONTROL_SET = 4;  
  
parameter          GLOBAL_RESET_COUNT = 12'h09c8;
```

TERRANOLOGIC

USB CPLD Development System User Manual

Next is the Internal Signal and Register Declarations.

TERRANOLOGIC

USB CPLD Development System User Manual

```

//*****
/* Internal Signals and Registers Declarations
//*****

    wire                CLK_66;
    wire                RST;

    reg                 transfer_out_reg;
    wire                transfer_in_received;
    wire [7:0]          transfer_in_byte;
    wire [7:0]          transfer_out_byte;
    reg [3:0]           transfer_to_host_counter;
    reg [3:0]           transfer_to_host_state;

    //Transfer Control registers
    reg                 transfer_in_loop_back;
    reg                 transfer_in_received_reg;
    reg [3:0]           transfer_control_state;
    reg [7:0]           transfer_control_byte;

    //Transfer Write from Arduino
    reg                 transfer_write_reg;
    reg                 transfer_write;
    reg [7:0]           transfer_write_byte;

    //Reset signals
    wire                reset;
    reg [11:0]          reset_counter;
    reg                 reset_signal_reg;

    //Input/Output Signals

```

TERRANOLOGIC

USB CPLD Development System User Manual

Next, add the assignments. These assignments will set the direction of the bus transceivers that interface to the Arduino I/O's. The transceivers also include an output enable bit.

```
//*****
//*      Signal Assignments
//*****

assign      TR_DIR_2  = 1'b1; //1 = A to B; 0 = B to A
assign      TR_OE_2   = 1'b0;

assign      TR_DIR_3  = 1'b1; //1 = A to B; 0 = B to A
assign      TR_OE_3   = 1'b0;

//Clock and Reset
assign      CLK_66    = aa[1];
assign      RST       = reset;
assign      reset     = reset_signal_reg;

//Transfer registers
assign      transfer_out = transfer_out_reg | transfer_write;
assign      transfer_out_byte = transfer_write_byte;

//LED3 is used to signify to the user that the Start
//switch is enabled
assign      LED3      = ~start_stop_cntrl;
```

The reset signal is generated by a counter that starts counting upon power up. When the counter reaches GLOBAL_RESET_COUNT.

TERRANOLOGIC

USB CPLD Development System User Manual

```

//*****
//*      Reset Signal
//*****

always @(posedge CLK_IN or negedge aa[0])
begin
    if(!aa[0])
    begin
        reset_signal_reg <= 1'b0;
        reset_counter <= 0;
    end
    else
    begin
        if( reset_counter < GLOBAL_RESET_COUNT )
        begin
            reset_signal_reg <= 1'b0;
            reset_counter <= reset_counter + 1'b1;
        end
        else
        begin
            reset_signal_reg <= 1'b1;
        end
    end
end
end
```

The four LED's are set by the bottom four bits of the active_trigger output register. These trigger outputs can be set by using a function in the Active_Host DLL on the PC. The Data Collector project will use LED3 to indicate the state of the Start/Stop signal.

```

//LED3 is used to signify to the user that the Start
//switch is enabled
assign          LED3 = ~start_stop_cntrl;
...
```

TERRANOLOGIC

USB CPLD Development System User Manual

```
//-----  
// LED Set  
//-----  
  
always @(trigger_in_byte or led_reset or LED or RST)  
begin  
    if(!RST)  
        LED[2:0] = 3'hz;  
    else if(led_reset)  
        LED[2:0] = 3'hz;  
    else if(trigger_in_byte[3:0])  
        begin  
            case(trigger_in_byte[3:0])  
                3'h1:  
                    LED[0] = 1'b0;  
                3'h2:  
                    LED[1] = 1'b0;  
                3'h4:  
                    LED[2] = 1'b0;  
                default:  
                    LED[2:0] = LED[2:0];  
            endcase  
        end  
    end  
end
```

The two user switches are connected to the input trigger register. Pressing a switch will send a trigger to the PC to be decoded by the Active_Host DLL.

TERRANOLOGIC

USB CPLD Development System User Manual

```
//-----
// User Switch Trigger
//-----
always @(posedge CLK_IN or negedge RST)
begin
    if(!RST)
    begin
        trigger_out <= 8'h00;
    end
    else
    begin
        if(!SW_USER_1 )
            trigger_out <= 8'h01;
        else if(!SW_USER_2 )
            trigger_out <= 8'h02;
        else if(switch_reset)
            trigger_out <= 8'h04;
        else
            trigger_out <= 8'h00;
    end
end
end
```

Next, we will add the transfer detection signal from the Arduino. This block will require three registers.

- transfer_write_reg –This is a latch register to hold the state of the A0(Write Enable)
- transfer_write –This register is used to start the active_transfer single byte write to the PC.
- transfer_write_byte –This is an 8 bit register to hold the value of the Data Collection output.

This block will compare the input signal on TRIGGER_IN_LOW[1] to a high. The TRIGGER_IN_LOW[1] pin is routed to Pin 1 of J9 which is routed to the A0(Write Enable) of the Arduino Data Collector. When this bit goes high, the priority encoder goes into statement 1 and sets transfer_write_reg and transfer_write high and latches the value on the LB_UPPER[7:0] pins to the transfer_write_byte register. By setting transfer_write_reg high, the priority encoder goes into statement 2 which will set transfer_write register to low and stay in statement 2 of the priority encoder. The back

TERRANOLOGIC

USB CPLD Development System User Manual

to back high and low on the transfer_write register will cause the active_transfer module to latch the value of transfer_write_byte into the active_transfer_library module and sets up the byte transfer to the PC. When the TRIGGER_IN_LOW[1] -A0(Write Enable) pin goes low, the encoder will reset transfer_write_reg and transfer_write to low. The encoder goes back to waiting for the TRIGGER_IN_LOW[1] -A0(Write Enable) to assert high.

```
//-----  
// Detect Transfer From Arduino  
//-----  
always @(posedge CLK_IN or negedge RST)  
begin  
    if (!RST)  
    begin  
        transfer_write_reg <= 1'b0;  
        transfer_write <= 1'b0;  
        transfer_write_byte <= 0;  
    end  
    else  
    begin  
        if (TRIGGER_IN_LOW[1] & !transfer_write_reg)  
        begin  
            transfer_write_reg <= 1'b1;  
            transfer_write <= 1'b1;  
            transfer_write_byte <= LB_UPPER;  
        end  
        else if (TRIGGER_IN_LOW[1] & transfer_write_reg)  
        begin  
            transfer_write_reg <= 1'b1;  
            transfer_write <= 1'b0;  
        end  
        else if (!TRIGGER_IN_LOW[1] & transfer_write_reg)  
        begin  
            transfer_write_reg <= 1'b0;  
            transfer_write <= 1'b0;  
            transfer_write_byte <= 0;  
        end  
    end  
end  
end
```

TERRANOLOGIC

USB CPLD Development System User Manual

This block of code takes care of reading the random word from the Arduino using the A0(Write Enable) Pin. However, because the Arduino is expecting a Start/Stop bit on Digital Pin8, the CPLD code has to provide this bit. This presents a problem, the UnoProLogic has 3 eight bit bi-directional ports. Which means each port is has a direction which is either input or ouput at a given time. However, the ports can be switched between input and output at any time. Two of the three ports must be used as inputs into the CPLD for the random word and the A0(Write Enable) Pin. So, the third port can be used as the output port.

TERRANOLOGIC

USB CPLD Development System User Manual

This, however, causes another problem! The Arduino XIOH connector needs to output the Amber LED state. So, if one pin on the connector needs to be an output, the UnoProLogic port on J10 (XIOH) cannot be an output! This would interfere with the turning on and turning off of the LED.

TERRANOLOGIC

USB CPLD Development System User Manual

So, we can fix this problem by noting that the 8 bit bi-directional ports on the UnoProLogic have Output Enables that allow the CPLD to “float” the signals of the port at any time. By floating the port, we can multiplex the signals of the port. When we need to drive the signals from the UnoProLogic port to the Arduino, we turn on the

TERRANOLOGIC

USB CPLD Development System User Manual

Output Enables of the port. And when we need to let the Arduino drive its signals, we turn off the Output Enables of the port.

```
//-----
// Detect Transfer From Arduino
//-----
always @(posedge CLK_66 or negedge RST)
begin
    if (!RST)
    begin
        transfer_write_reg <= 1'b0;
        transfer_write <= 1'b0;
        transfer_write_byte <= 0;
        TR_DIR_1 <= 1'b0; //1 = A to B; 0 = B to A
        TR_OE_1 <= 1'b0;
        LB_LOWER[0] <= start_stop_cntrl;
        LB_LOWER[7:1] <= 7'b0100000;
    end
end
```

In the reset section of the synchronous block, we turn the Direction bit to “B to A”

TR_DIR_1 <= 1'b0;

and the Output Enable on.

TR_OE_1 <= 1'b0; (Output Enables are asserted with a zero)

The start_stop_cntrl signal is set by using the TRANSFER_CONTROL state machine in the following section. So, if the start_stop_cntrl signal is set, the Output Enable is turned on and the signal will appear on DigitalPin8 on the Arduino XIOH connector. As the Data Collector code cycles through its loop() function, it will cause the if statement to branch into its conditional statement. The Data Collector code will assert the A0(Write Enable) Pin in its conditional statement. The A0(Write Enable) Pin will cause the CPLD code to enter into its first conditional statement. This first statement turns off the Output Enables of the Port J10. With the Port turned off, the Arduino can set the LED on when it executes its code. When the A0(Write Enable) Pin is de-asserted, the Output Enable of Port J10 is turned back on and the whole process can start over.

Next, we add a TRANSFER_CONTROL state machine to read the Control Register from the Host PC using the active_transfer EndTerm. This state machine will decode the 8 bit control register only after a sequence of three 8 bit bytes in the order of 0x5a, 0xc3, 0x7e. The operation of the state machine is as follows.

TERRANOLOGIC

USB CPLD Development System User Manual

- The TRANSFER_CONTROL state machine will stay in the idle state of the parallel encoder until a byte from the active_transfer transfer_to_device register receives a 0x5a.
- This will cause the transfer_control_state to be changed to TRANSFER_CONTROL_HDR1.
- The state machine will stay in the TRANSFER_CONTROL_HDR1 state until the next byte is read from the active_transfer.
- If the byte from transfer_to_device is a 0xc3, the transfer_control_state will be changed to TRANSFER_CONTROL_HDR2.
- If the byte from transfer_to_device is not a 0xc3, the transfer_control_state will go back to idle.
- In the TRANSFER_CONTROL_HDR2 state, the state machine will stay in this state until the next byte from the active_transfer is received.
- If the byte from transfer_to_device is a 0x7e, the transfer_control_state will be changed to TRANSFER_DECODE_BYTE.
- If the byte from transfer_to_device is not a 0x7e, the transfer_control_state will go back to idle.
- In the TRANSFER_DECODE_BYTE state, the state machine will stay in this state until the next byte from the active_transfer.
- The next byte transferred from active_transfer will be decoded as the Control Register.

The bits of the Control Register are defined below.

Register	Bits	Description	Assertion
Control	0	Start Stop Cntrl	High
	1	Not Used	
	2	LED Reset	High
	3	Switch Reset	High
	4	Transfer In Loop Back	High
	5	Not Used	
	6	Not Used	
	7	Not Used	
	7	Not Used

        if (transfer_in_received & !transfer_in_received_reg)  
        begin  
            transfer_in_received_reg <= 1'b1;  
            case (transfer_control_state)  
                TRANSFER_CONTROL_IDLE:  
                    if ((transfer_in_byte == TRANSFER_CONTROL_BYTE1))  
                        transfer_control_state <= TRANSFER_CONTROL_HDR1;  
                    else if ((transfer_in_byte != TRANSFER_CONTROL_BYTE1))  
                        transfer_control_state <= TRANSFER_CONTROL_IDLE;  
                    else  
                        transfer_control_state <= TRANSFER_CONTROL_IDLE;  
                TRANSFER_CONTROL_HDR1:  
                    if ((transfer_in_byte == TRANSFER_CONTROL_BYTE2))  
                        transfer_control_state <= TRANSFER_CONTROL_HDR2;  
                    else if ((transfer_in_byte != TRANSFER_CONTROL_BYTE2))
```

TERRANOLOGIC

USB CPLD Development System User Manual

```

        transfer_control_state <= TRANSFER_CONTROL_IDLE;
    else
        transfer_control_state <= TRANSFER_CONTROL_HDR1;
TRANSFER_CONTROL_HDR2:
    if((transfer_in_byte == TRANSFER_CONTROL_BYTE3))
        transfer_control_state <= TRANSFER_DECODE_BYTE;
    else if((transfer_in_byte != TRANSFER_CONTROL_BYTE3))
        transfer_control_state <= TRANSFER_CONTROL_IDLE;
    else
        transfer_control_state <= TRANSFER_CONTROL_HDR2;
TRANSFER_DECODE_BYTE:
begin
    transfer_in_loop_back <= transfer_in_byte[0];
    led_reset <= transfer_in_byte[2];
    switch_reset <= transfer_in_byte[3];
    transfer_loopback_state <= TRANSFER_LOOPBACK_SET;
end
TRANSFER_CONTROL_SET:
begin
    transfer_control_state <= TRANSFER_CONTROL_IDLE;
end
endcase
end
else if(!transfer_in_received & transfer_in_received_reg)
    transfer_in_received_reg <= 1'b0;
end
end
end

```

Next, up is the instantiation for the active_transfer_library. The ports include the input and output pins and the two buses that connect the active modules. These buses are the input UC_IN[23:0] and output UC_OUT[21:0].

TERRANOLOGIC

USB CPLD Development System User Manual

```
//-----  
// Instantiate the EPT Active Transfer Library  
//-----  
  
active_transfer_library    ACTIVE_TRANSFER_LIBRARY_INST  
(  
    .aa                    (aa) ,  
    .bc_in                 (bc_in) ,  
    .bc_out                (bc_out) ,  
    .bd_inout              (bd_inout) ,  
  
    .UC_IN                 (UC_IN) ,  
    .UC_OUT                (UC_OUT)  
  
);
```

Finally, we instantiate the Active EndTerms. For the Data Collection project, we only need `active_transfer` and `active_trigger` EndTerms. The `uc_out` port for both modules must be shared. Since they both drive this bus, a bus wide wired-or circuit is used so that they don't drive each other. The `active_transfer` EndTerm has a port for the address (`uc_addr`). This allows the PC to address up to 8 different modules. Just add a three bit address to this port and the PC must add this same address to communicate with this module.

TERRANOLOGIC

USB CPLD Development System User Manual

```
//-----  
// Instantiate the EPT Active Modules  
//-----  
wire [22*2-1:0] uc_out_m;  
eptWireOR # (.N(2)) wireOR (UC_OUT, uc_out_m);  
active_trigger ACTIVE_TRIGGER_INST  
(  
    .uc_clk          (CLK_IN),  
    .uc_reset        (RST),  
    .uc_in           (UC_IN),  
    // .uc_out        (UC_OUT),  
    .uc_out          (uc_out_m[ 0*22 +: 22 ]),  
  
    .trigger_to_host (trigger_out),  
    .trigger_to_device (trigger_in_byte)  
);  
  
active_transfer ACTIVE_TRANSFER_INST  
(  
    .uc_clk          (CLK_IN),  
    .uc_reset        (RST),  
    .uc_in           (UC_IN),  
    // .uc_out        (UC_OUT),  
    .uc_out          (uc_out_m[ 1*22 +: 22 ]),  
  
    .start_transfer  (transfer_out),  
    .transfer_received (transfer_in_received),  
  
    .uc_addr          (3'h2),  
  
    .transfer_to_host (transfer_out_byte),  
    .transfer_to_device (transfer_in_byte)  
);
```

Next, we are ready to compile and synthesize.

TERRANOLOGIC

USB CPLD Development System User Manual

9.1.9 CPLD: Compile/Synthesize the Project

The Quartus Prime application will compile/ synthesize the user code, active_transfer_library, and the active EndTerms. The result of this step is a file containing the CPLD code with “*.pof”. First, we need to create a project in the Quartus Prime environment. Follow the directions in the section: “Compiling, Synthesizing, and Programming CPLD”.

Bring up Quartus Prime, then use Windows Explorer to browse to c:/altera/xxx/quartus/qdesigns create a new directory called: “EPT_Data_Collector”.

Open Quartus Prime by clicking on the icon .

Under Quartus, Select File->New Project Wizard. The Wizard will walk you through setting up files and directories for your project.

TERRANOLOGIC

USB CPLD Development System User Manual

At the Top-Level Entity page, browse to the `c:\altera\xxx\quartus\qdesigns\EPT_Data_Collector` directory to store your project. Type in a name for your project “EPT_570_AP_U2_Top”.

Follow the steps up to Add Files. At the Add Files box, click on the Browse button and navigate to the project Data Collector install folder in the dialog box. Browse to the `\Projects_HDL\EPT_Data_Collector\EPT_570_AP_U2_Top` folder of the UnoProLogic Development System CD. Copy the files from the `\src` directory.

- Active_transfer.vqm
- Active_trigger.vqm
- Active_transfer_library.vqm
- eptWireOr.v
- ETP_570_AP_U2_Top.v

Add the files:

TERRANOLOGIC

USB CPLD Development System User Manual

Continue following the instructions by adding a device and finishing the project instantiation. Then, add the Pins.

- Under Assignments, Select Import Assignments.
- At the Import Assignment dialog box, browse to the \Projects_HDL\EPT_Data_Collector\EPT_570_AP_U2_Top folder of the UnoProLogic Development System CD. Select the Quartus Specification file, “EPT_570_AP_U2_Top.qsf”.
- Click Ok. Under Assignments, Select Pin Planner. Verify the pins have been imported correctly.

Next, we need to add the Synopsys Design Constraint file. This file contains timing constraints which forces the built in tool called TimeQuest Timing Analyzer to analyze the path of the synthesized HDL code with setup and hold times of the internal registers.

TERRANOLOGIC

USB CPLD Development System User Manual

It takes note of any path that may be too long to appropriately meet the timing qualifications. For more information on TimeQuest Timing Analyzer, see

[http://www.altera.com/literature/hb/qts/qts_qii53018.pdf?GSA_pos=1&WT.oss_r=1&WT.oss=TimeQuest Timing Analyzer](http://www.altera.com/literature/hb/qts/qts_qii53018.pdf?GSA_pos=1&WT.oss_r=1&WT.oss=TimeQuest%20Timing%20Analyzer)

Browse to the \Projects_HDL\EPT_Data_Collector\EPT_UnoProLogic_TOP folder of the UnoProLogic Development System CD. Select the “EPT_570_AP_U2_Top.sdc” file.

Copy the file and browse to c:\altera\xxx\quartus\qdesigns\EPT_Data_Collector directory. Paste the file.

TERRANOLOGIC

USB CPLD Development System User Manual

and select the Start Compilation button.

This will cause the compile and synthesization process. After successful completion, the screen should look like the following:

TERRANOLOGIC

USB CPLD Development System User Manual

If the synthesis fails, you will see the failure message in the message window. Note that in addition to fatal errors, the compile process can produce “warnings” which do not necessarily prevent execution of the code but which should be corrected eventually.

At this point the project has been successfully compiled, synthesized and a programming file has been produced. See the next section on how to program the CPLD.

9.1.10 **CPLD: Program the CPLD**

The final step is programming the “*.pof” file into the CPLD. Follow the section: “Programming the CPLD”.

TERRANOLOGIC

USB CPLD Development System User Manual

- Connect the UnoProLogic to the PC,
- Open up Quartus Prime,
- Open the programmer tool
- In the upper left corner of the Programmer Tool, there is a button labeled “Hardware Setup”. Verify that EPT-Blaster v1.6” has been selected. If not, go to the section JTAG DLL Insert to Quartus Prime and follow the directions.
- Check the box under Program/Configure
- Click the Start button.

When the programming is complete, the Progress bar will indicate success.

TERRANOLOGIC

USB CPLD Development System User Manual

At this point, the UnoProLogic is programmed and ready for use.

9.1.11 PC: Design the Project

The final piece of the Data Collection Sampler is the PC application. This application will fetch the data from the CPLD of the UnoProLogic and display it on the screen. It includes user code, windows form, and the Active_Host DLL.

The Active_Host DLL is designed to transfer data from the CPLD when it becomes available. The data will be stored into local memory of the PC, and an event will be triggered to inform the user code that data is available from the addressed module of the CPLD. This method, from the user code on the PC, makes the data transfer transparent. The data just appears in memory and the user code will direct the data to a textbox on the Windows Form.

The Data Collector project will perform the following functions.

- Find UnoProLogic Device.
- Open UnoProLogic Device.

TERRANOLOGIC

USB CPLD Development System User Manual

- Start the Arduino data collection process.
- Wait for data from UnoProLogic.
- Display data from UnoProLogic in textbox.

9.1.12 PC: Coding the Project

The user code is based on the .NET Framework and written in C#. The language is great for beginners as it is a subset of the C++ language. It has the look and feel of the familiar C language but adds the ease of use of classes, inheritance and method overloading. C# is an event based language which changes the method of writing code for this project. See the section “Assembling, Building, and Executing a .NET Project on the PC” for a better description of event based language programming.

To start the project, follow the section “Assembling, Building, and Executing a .NET Project on the PC”. Use the wizard to create project called “Data_Collector”. When the wizard completes, the C# Express main window will look like the following.

```
using System;
using System.Drawing;
using System.Collections;
using System.Windows.Forms;
using System.Data;
using System.Threading;
using System.Runtime.InteropServices;
using System.Diagnostics;

namespace Data_Collector
{
    public partial class Data_Collector : System.Windows.Forms.Form
    {
        public Data_Collector()...
```

These statements setup the namespace and the class for the project. There are several other files that are created by the wizard such as Form1.Designer.cs, Program.cs, Form1.resx. We don't need to go into these support files, we will just focus on the Form1.cs as this is where all the user code goes.

TERRANOLOGIC

USB CPLD Development System User Manual

The project environment must be set up correctly in order to produce an application that runs correctly on the target platform. Visual C# Express defaults new projects to 32 bits. If you OS is a 64 bit platform, use the following directions to set up a 64 bit project. First, we need tell C# Express to produce 64 bit code if we are running on a x64 platform. Go to Tools->Settings and select Expert Settings

Go to Tools->Options, locate the “Show all settings” check box. Check the box.

In the window on the left, go to “Projects and Solutions”. Locate the “Show advanced build configurations” check box. Check the box.

TERRANOLOGIC

USB CPLD Development System User Manual

Go to Build->Configuration Manager.

In the Configuration Manager window, locate the “Active solution platform:” label, select “New” from the drop down box.

TERRANOLOGIC

USB CPLD Development System User Manual

In the New Solution Platform window, click on the drop down box under “Type or select the new platform:”. Select “x64”.

Click the Ok button. Verify that the “Active Solution Platform” and the “Platform” tab are both showing “x64”.

TERRANOLOGIC

USB CPLD Development System User Manual

Click Close.

Then, using the Solution Explorer, you can right click on the project, select Properties and click on the Build tab on the right of the properties window.

Verify that the “Platform:” label has “Active (x64)” selected from the drop down box.

TERRANOLOGIC

USB CPLD Development System User Manual

Next, unsafe code needs to be allowed so that C# can be passed pointer values from the Active Host. Right click on the “Data Collector” project in the Solution Explorer. Select Properties.

Now we are ready to start coding.

Next, we add two classes for our device. One class stores the information useful for our device for Transmit to the EndTerms such as, address of module, length of transfer etc.

TERRANOLOGIC

USB CPLD Development System User Manual

```
//Create an array of the Transfer Class for device
Transfer[] EPTTransmitDevice = new Transfer[8];
```

The next class is used to store parameters for receiving data from the device.

```
//Create a Receive object of the Transfer Class.
Transfer EPTReceiveData = new Transfer();
```

UnoProLogic

The first function called when the Windows Form loads up is the `Data_Collector_Load()`. This function is called automatically upon the completion of the Windows Form, so there is no need to do anything to call it. Once this function is called, it in turn calls the `ListDevices()`.

```
// Main object loader
private void Data_Collector_Load (object sender, System.EventArgs e)
{
    // Call the List Devices function
    ListDevices();
}
```

The `ListDevices()` function calls the `EPT_AH_Open()` function to load up the ActiveHost Dll. Next, it calls `EPT_AH_QueryDevices()` which searches through the registry files to determine the number of EPT devices attached to the PC. Next, `EPT_AH_GetDeviceName()` is called inside a for loop to return the ASCII name of each device attached to the PC. It will automatically populate the combo box, `cmbDevList` with all the EPT devices it finds.

TERRANOLOGIC

USB CPLD Development System User Manual

```
// List Devices| function
private unsafe Int32 ListDevices ()
{
    Int32 result;
    Int32 num_devices;
    Int32 iCurrentIndex;

    // Open the DLL
    result = EPT_AH_Open(null, null, null);
    if (result != 0)
    {
        MessageBox.Show("Could not attach to the ActiveHost library");
        return 0;
    }

    // Query connected devices
    num_devices = EPT_AH_QueryDevices();

    //Prepare the Combo box for population
    iCurrentIndex = cmbDevList.SelectedIndex;
    cmbDevList.Items.Clear();

    // Go through all available devices
    for (device_index = 0; device_index < num_devices; device_index++)
    {
        String str;
        str = Marshal.PtrToStringAnsi((IntPtr)EPT_AH_GetDeviceName(device_index));
        cmbDevList.Items.Add(str);
    }
    return 0;
}
```

The user will select the device from the drop down combo box. This value can be sent to the OpenDevice() function using the button Click of the Open button.

TERRANOLOGIC

USB CPLD Development System User Manual

```
// Open the device
if (EPT_AH_OpenDeviceByIndex(device_index) == false)
{
    printf("Could not open device %s\n", EPT_AH_GetDeviceName(device_index));
    exit(0);
}
```

The `device_index` variable is used to store the index of the device selected from the combo box. This variable is passed into the `EPT_AH_OpenDeviceByIndex()`. This process is started by the user clicking on the “Open” button. If the function is successful, the device name is displayed in the label, `labelDeviceCnt`. Next, the device is made the active device and the call back function is registered using the `RegisterCallBack()` function. Finally, the Open button is grayed out and the Close button is made active.

TERRANOLOGIC

USB CPLD Development System User Manual

```
// Open the device
public unsafe Int32 OpenDevice()
{
    device_index = (int)cmbDevList.SelectedIndex;
    if (EPT_AH_OpenDeviceByIndex(device_index) == 0)
    {
        String message = "Could not open device " +
            Marshal.PtrToStringAnsi((IntPtr)EPT_AH_GetDeviceName(device_index)) + ", " +
            Marshal.PtrToStringAnsi((IntPtr)EPT_AH_GetDeviceSerial(device_index));
        MessageBox.Show(message);
        return 0;
    }
    else
    {
        labelDeviceCnt.Text = "Connected to device " +
            Marshal.PtrToStringAnsi((IntPtr)EPT_AH_GetDeviceName(device_index)) + ", " +
            Marshal.PtrToStringAnsi((IntPtr)EPT_AH_GetDeviceSerial(device_index));
    }

    // Make the opened device the active device
    if (EPT_AH_SelectActiveDeviceByIndex(device_index) == 0)
    {
        String message = "Error selecting device: %s " +
            Marshal.PtrToStringAnsi((IntPtr)EPT_AH_GetLastError());
        MessageBox.Show(message);
        return 0;
    }

    // Register the read callback function
    RegisterCallBack();
    btnOpenDevice.Enabled = false;
    btnCloseDevice.Enabled = true;
    return 0;
}
```

Next, the callback function is populated. This function will be called from the Active Host dll. When the EPT Device has transferred data to the PC, the callback function will do something with the data and command.

TERRANOLOGIC

USB CPLD Development System User Manual

```
// Actual callback function which will read messages coming from the EPT device
unsafe void EPTRedFunction(Int32 device_id, Int32 device_channel, byte command, byte payload,
{
    byte* message = data;

    // Select current device
    EPT_AH_SelectActiveDeviceByIndex(device_id);

    //Add command and device_channel to the receive object
    EPTReceiveData.Command = ((command & COMMAND_DECODE) >> 3);
    EPTReceiveData.Address = device_channel;

    //Check if the command is Block Receive. If so,
    //use Marshalling to copy the buffer into the receive
    //object
    if (EPTReceiveData.Command == BLOCK_OUT_COMMAND)
    {
        EPTReceiveData.Length = data_size;
        EPTReceiveData.cBlockBuf = new Byte[data_size];

        Marshal.Copy(new IntPtr(message), EPTReceiveData.cBlockBuf, 0, data_size);
    }
    else
    {
        EPTReceiveData.Payload = payload;
    }
    EPTParseReceive();
}
```

Because the callback function communicates directly with the dll and must pass pointers from the dll to the C#, marshaling must be used. Marshaling is an advanced topic and will not be covered in this manual.

When EPTRedFunction() callback is called and passed parameters from the Active Host dll, it populates the EPTReceiveData object. It then calls EPTParseReceive() function. This function uses a case statement to call the TransferOutReceive() function.

TERRANOLOGIC

USB CPLD Development System User Manual

```
private void EPTParseReceive()
{
    switch (EPTReceiveData.Command)
    {
        case TRANSFER_OUT_COMMAND:
            TransferOutReceive();
            break;
        default:
            break;
    }
}
```

TransferOut Receive() creates a string from the EPTReceiveData.Payload parameter. Then sends the string to the textbox, tbDataBytes.

```
public void TransferOutReceive()
{
    string WriteRcvChar = "";
    WriteRcvChar = String.Format("{0}", (int)EPTReceiveData.Payload);
    tbDataBytes.AppendText(WriteRcvChar + " ");
}
```

Controls such as buttons are added to the Form1.cs[Design] window which allow turning on and off signals. These include

- btnWriteByte
- btnTransferReset
- btnOk
- btnClose
- btnResetBlock

Refer to section 1.6.4 Adding Controls to the Project for details about using the ToolBox to place controls on a design. The btnWriteByte click event calls the EPT_AH_SendTransferControlByte(). This function is used to turn on/off bits in the Control Register in the CPLD code. The btnWriteByte will set the start_stop_cntrl signal in the CPLD to one. This signal starts the Arduino Data Collector sending its random word to the CPLD.

TERRANOLOGIC

USB CPLD Development System User Manual

```
private void btnWriteByte_Click(object sender, EventArgs e)
{
    int address_to_device;
    address_to_device = Convert.ToInt32(tbAddress.Text);
    EPT_AH_SendTransferControlByte((char)2, (char)1);
}
```

The btnTransferReset sets the start_stop_cntrl bit in the Control Register to zero. This action will cause the Arduino Data Collector to stop sending the random word to the CPLD.

```
private void btnTransferReset_Click(object sender, EventArgs e)
{
    int address_to_device;
    address_to_device = Convert.ToInt32(tbAddress.Text);
    EPT_AH_SendTransferControlByte((char)address_to_device, (char)0);
}
```

The btnResetBlock button will clear the tbDataBytes textblock. The Clear() method is inherited from the textbox class.

```
private void btnResetBlock_Click(object sender, EventArgs e)
{
    tbDataBytes.Clear();
}
```

The btnOk and btnClose buttons are used to end the application. It calls the function EPT_AH_CloseDeviceByIndex() to remove the device from the Active Host dll. The buttons btnOpen and btnClose have their Enabled parameter set to true and false respectively. The Enabled parameter controls whether the button is allowed to launch an event or not. If it is not enabled, the button is grayed out. At the end of each click event, the Application.Exit() method is called. This exits the form.

TERRANOLOGIC

USB CPLD Development System User Manual

```
private void btnOk_Click(object sender, EventArgs e)
{
    EPT_AH_CloseDeviceByIndex(device_index);
    btnOpenDevice.Enabled = true;
    btnCloseDevice.Enabled = false;

    lblDeviceConnected.Text = "";
    Application.Exit();
}

private void btnCancel_Click(object sender, EventArgs e)
{
    EPT_AH_CloseDeviceByIndex(device_index);
    btnOpenDevice.Enabled = true;
    btnCloseDevice.Enabled = false;

    lblDeviceConnected.Text = "";
    Application.Exit();
}
```

This is all that is needed for the Data Collector project. The Arduino will generate a random 8 bit word. It then transmits that word to the CPLD using the A0 (WRITE_ENABLE) signal. The CPLD transmits the 8 bit word to the PC using the ACTIVE TRANSFER module of the Active_Transfer Library. The dll reads the 8 bit word into local memory. It then calls the Callback function, EPTReadFunction. The 8 bit is finally displayed to screen using the MessageBox.Show().

9.1.13 PC: Compiling the Active Host Application

Building the Data_Collector project will compile the code in the project and produce an executable file. It will link all of the functions declared in the opening of the Data_Collector Class with the Active Host dll. The project will also automatically link the FTD2XX.dll to the object code. Follow section: Assembling, Building, and Executing a .NET Project on the PC. Browse to the \Projects_ActiveHost_xxBit\EPT_Data_Collector\Data_Collector\ folder of the UnoProLogic Development System CD. Copy the following files into the project.

- Active_transfer_xxx.cs
- Data_Collector.csproj

TERRANOLOGIC

USB CPLD Development System User Manual

- Data_Collector.csproj.user
- Form1.cs
- Form1.Designer.cs
- Program.cs

To build the project, go to Debug->Build Solution.

The C# Express compiler will start the building process. If there are no errors with code syntax, function usage, or linking, then the environment responds with “Build Succeeded”.

If the build fails, you will have to examine each error in the “Error List” and fix it accordingly. If you cannot fix the error using troubleshooting methods, post a topic in the Terranologic Forum. All topics will be answered by a member of the technical staff as soon as possible.

TERRANOLOGIC

USB CPLD Development System User Manual

9.1.14 Adding the DLL's to the Project

Locate the UnoProLogic Development System CD installed on your PC. Browse to the Projects_ActiveHost folder (choose either the 32 bit or 64 bit version, depending on whether your OS is 32 or 64 bit). Open the Bin folder, copy the following files:

- ActiveHostXX.dll
- ftd2xxXX.dll

and install them in the bin\x64\x64 folder of your EPT_Data_Collector project.

Save the project.

At this point, the environment has produced an executable file and is ready for testing. Next, we will connect everything together and see it collect data and display it.

9.1.15 Connecting the Project Together

Now we will connect the Arduino, UnoProLogic, and the PC to make a Data Collector. First, connect a USB cable from a USB port on the PC to the Arduino. Second, connect a USB cable from a open USB port on the PC to the UnoProLogic.

TERRANOLOGIC

USB CPLD Development System User Manual

Next, open the Arduino IDE and select File->Open and select your sketch created earlier, Arduino Data Collector Code U2.ino.

Select the file and click Open. The sketch will now populate the Arduino IDE window. Compile and Download the sketch into the Arduino microcontroller using the Upload button.

TERRANOLOGIC

USB CPLD Development System User Manual

The Arduino IDE will compile the project, then transmit the machine level code into the ATmega328 SRAM to start the program. When this is complete, the Yellow L LED will blink about once per second.

TERRANOLOGIC

USB CPLD Development System User Manual

If this LED is blinking at the rate of once per second, the Arduino and the Data Collector project are ready for the EPT 570-AP-U2 code.

The CPLD should already be programmed with its Data Collector Project. If it isn't, follow the instructions in section 3.1.10.

Open the EPT Data Collector on the PC by browsing to the Data Collector project folder. Locate the executable in the \bin\x64\Release folder.

Initiate the application by double clicking the application icon in the \Release folder of the project. The application will open and automatically load the Active Host dll. The application will locate the EPT 570-AP-U2 device. Next, the combo box at the top will be populated with the name of the device.

TERRANOLOGIC

USB CPLD Development System User Manual

Select the EPT 570-AP device and click the Open button. If the Active Host application connects to the device, a label will indicate “Device Connected”. Next, select the address of the Active Transfer module in the CPLD. In our case it is “2”.

9.1.16 Testing the Project

To test our Data Collector project, just click on the Start button. As soon as the device connects, the data from the Arduino will appear in the received data textBox.

TERRANOLOGIC

USB CPLD Development System User Manual

And that's all there is to the Data Collector Project. It's up to the user to use this project as a base to create much larger projects. You can easily make a volt meter using this project by turning off the Random number generator in the Arduino and reading the Analog Pins. Also, reformat the textBox display that it shows in decimal instead of the Hexadecimal display.
